Gordon asserts that "'the failure to keep the Morse code telegraphy requirement intact, at least as a required examination element for the Amateur Extra Class operator license, fails to take into consideration the significant national security implications that require retaining adequate examination safeguards to insure the viability that Morse code telegraphy provides, not only to the Amateur service, but the nation as well.'" Gordon argues that the requirement should be retained so that amateur operators can act as "a 'strategic reserve,'" because there is "no assurance that...voice or digital modes will even be operationally viable in future emergency communication environments."

The FCC was not persuaded, however, that eliminating the Morse code examination element will affect national security or emergency communications. "We agree with the commenters who point out that requiring applicants to pass a one-time telegraphy examination did not and would not guarantee a supply of skilled telegraphy operators. Moreover, nothing in the Commission's decision prevents an interested amateur radio operator from pursuing Morse code proficiency."

The FCC reiterated their prior conclusion that "an individual's ability to demonstrate Morse code proficiency does not further the underlying purposes of the Part 97 rules, i.e., to accommodate individual contributions to the advancement of the radio art and to enhance the value of the amateur service to the public. Accordingly, we deny the petition."

In the MOO, Ward states that he "encountered difficulty" in submitting his comments and reply comments to the NPRM electronically and that his filings were not posted on the ECFS (the Commission's electronic filing system) until after the deadlines had passed. He asserts that "there is no certainty that the Commission considered his comments and reply comments, that the late posting of his comments prevented others from replying to them, and that it is 'quite likely that other comments were treated improperly.'" As a result, Ward requested that the FCC "stay the proceeding, reopen the record and reconsider the NPRM after the close of the extended comment period."

The FCC claims that all comments in the ECFS "were considered before the Commission adopted the Report and Order, regardless of the how or when they were filed. Moreover, many of the 3900 comments and reply comments expressed the same view as Mr. Ward, so the substance of his views unquestionably was replied to and considered. Finally, he provides no evidence that ECFS mishandled other comments. No other party has complained that his or her comments were not received. We conclude, therefore, that reopening the proceeding for additional comments is not justified, and we deny the petition."

In summary, the FCC said neither petition asserted "any grounds for reconsidering" the decision in the Report and Order. "We believe that the actions taken therein will allow amateur service licensees to better fulfill the purpose of the amateur service, and will enhance the usefulness of the amateur service to the public and licensees."

==>SOLAR UPDATE

Tad "They have never seen the sunshine, nor the glory" Cook, K7RA, this week reports: A sunspot emerged a few days ago, a welcome sight at Cycle minimum. Sunspot numbers for February 25-28 were 12, 13, 12 and 12, but that spot (number 983) is now gone over the eastern horizon of our Sun. If the February 29 sunspot number is zero, this means our three-month moving average of sunspot numbers centered on January will be 8.5, slightly higher than the last reading. Our moving average centered on June 2007-January 2008 is 18.7, 15.4, 10.2, 5.4, 3, 6.9, 8.1 and 8.5, with the minimum centered on October 2007. Sunspot numbers for February 21-27 were 0, 0, 0, 0, 12, 13 and 12 with a mean of 5.3. The 10.7 cm flux was 71.8, 72.4, 71.6, 70.7, 71.4, 70.7 and 70.7 with a mean of 71.3. Estimated planetary A indices were 6, 4, 4, 3, 3, 3 and 12 with a mean of 5. Estimated mid-latitude A indices were 3, 3, 3, 2, 1, 2 and 6 with a mean of 2.9. Remember that a sunspot number does not represent the actual number of sunspots. The minimum non-zero sunspot number is 11, because a value of 10 is counted for each cluster of sunspots; a value of one is added for each individual spot. So the February 26 sunspot number of 13 represents one group containing three sunspots. For more information concerning radio propagation, visit the ARRL Technical Information Service Propagation page <http://www.arrl.org/tis/info/propagation.html>. To read this week's Solar Report in its entirety, check out the W1AW Propagation Bulletin page <http://www.arrl.org/w1aw/prop/>. This week's "Tad Cookism" brought to you courtesy of Elizabeth Barrett Browning.

==>IN BRIEF:

* This Weekend on the Radio: This weekend, the ARRL International DX Contest (Phone) is March 1-2. The NCCC Sprint is February 29 and the Wake-Up! QRP Sprint is March 1. The low band portion of the Open Ukraine RTTY Championship is March 1 and 2; the high band portion is March 2. The DARC 10 Meter Digital Contest is March 2 and the RSGB 80 Meter Club Championship (Data) is March 3. The ARS Spartan Sprint and another running of the NCCC Sprint are March 4. Next weekend starts with the NCCC Sprint on March 7. The AGCW QRP Contest and SOC Marathon Sprint are March 8. The RSGB Commonwealth Contest, the Oklahoma QSO Party, the EA PSK31 Contest and the Idaho QSO Party are March 8-9. The North American Sprint (RTTY), the SKCC Weekend Sprintathon, the UBA Spring Contest (CW) and the NSARA Contest are March 9. The Wisconsin QSO Party is March 9-10 and the CLARA and Family HF Contest is March 11-12. The RSGB 80 Meter Club Championship (CW) is March 12. See the ARRL Contest Branch page <http://www.arrl.org/contests/>, the ARRL Contester's Rate Sheet <http://www.arrl.org/contests/rate-sheet/> and the WA7BNM Contest Calendar <http://www.hornucopia.com/contestcal/index.html> for more info.

* ARRL Continuing Education Course Registration: Registration remains open through Sunday, March, 9, 2008, for these online course sessions beginning on Friday, March, 21, 2008: Amateur Radio Emergency Communications Level 2 (EC-002); Amateur Radio Emergency Communications Level 3 (EC-003R2); Antenna

Modeling (EC-004); HF Digital Communications (EC-005); VHF/UHF -- Life Beyond the Repeater (EC-008), and Radio Frequency Propagation (EC-011). Each online course has been developed in segments -- learning units with objectives, informative text, student activities and quizzes. Courses are interactive, and some include direct communications with a Mentor/Instructor. Students register for a particular session that may be 8, 12 or 16 weeks (depending on the course) and they may access the course at any time of day during the course period, completing lessons and activities at times convenient for their personal schedule. Mentors assist students by answering questions, reviewing assignments and activities, as well as providing helpful feedback. Interaction with mentors is conducted through e-mail; there is no appointed time the student must be present -- allowing complete flexibility for the student to work when and where it is convenient. To learn more, visit the CCE Course Listing page <http://www.arrl.org/cce/courses.html> or contact the Continuing Education Program Coordinator <cce@arrl.org>.

* ARRL Gearing for Up Dayton Hamvention: ARRL EXPO returns to Dayton Hamvention, to be held May 16-18, 2008 at the Hara Arena in Dayton, Ohio. The huge ARRL exhibit area is a showcase of displays, activities and program representatives to enhance your ham radio experience. The ARRL EXPO is open to all Hamvention attendees. Meet ARRL President Joel Harrison, W5ZN, other ARRL officials, volunteers and staff knowledgeable on a wide variety of topics. Among the highlights of the exhibit space will be a card checking area for operating awards, activities for young hams, the ARRL bookstore and more. ARRL Membership Manager Katie Breen, W1KRB, is the ARRL EXPO coordinator. "We are looking at some new and exciting venues within EXPO, but I'm not ready to spill the beans quite yet! We are focusing our attention this year on the theme of technology and on Hamvention's theme celebrating ham radio fellowship -- stay tuned for more news. We sincerely thank the 2008 Dayton Hamvention Committee and their volunteers for all they do to make this a signature convention; we are so pleased to participate." Keep an eye on the ARRL EXPO Web site <http://www.arrl.org/expo> for updates.

* W1HQ Now Up and Running -- on the World Wide Web: ARRL Membership Manager Katie Breen, W1KRB, has started a blog <http://www.arrl.org/blog/The%20Rebirth%20of%20W1HQ> chronicling the rebirth of the ARRL employee's club station, the Laird Campbell Memorial Station, W1HQ. "I've created this blog as a method of tracking our activities at the ARRL employee's club station," Breen said. Along with Contest Branch Manager Sean Kutzko, KX9X, she has led the charge to spiff up the station by giving the room a much-needed coat of new paint. Ed Hare, W1RFI, constructed all-new desks and cabinets. Building Manager Greg Kwasowski, W1GJK, installed new carpet and ceiling tiles. Test Engineer Mike Tracy, KC1SX, and Lab Assistant Anthony Nesta, AA1RZ, ran new antenna cables to the roof and rewired the entire room with a new antenna patch panel to accommodate all the new antenna feed lines. Lab Engineer Mike Gruber, W1MG, built a trap vertical. Read along as Breen, Kutzko and the rest of the W1HQ Crew bring W1HQ back to life and back on the air. You can also check out blogs <http://www.arrl.org/blog/> from past ARRL events, such as Dayton Hamvention and ARRL Expo, the 2007 ARRL National Convention and Field Day. DXCC Manager Bill Moore, NC1L, also keeps a blog discussing news and notes concerning the DXCC

program.

* Wisconsin Hams Assist Injured Driver: On Wednesday, February 27, Brian Sprecher, KC9LCC, of Prairie Du Sac, Wisconsin, received a radio call on the 147.150 Madison repeater requesting emergency help. Robert Stout, WB9ECK, of Monticello, Wisconsin, told Sprecher that a vehicle had gone off the road through a guard rail, stopping short of a creek. The driver was injured and trapped in his vehicle and an ambulance was needed at the scene. Sprecher called the Dane County sheriff's office to relay the information. Stout, via the repeater, kept Sprecher apprised of the driver's injuries; Sprecher, in turn, updated the sheriff's dispatch with the information. Stout remained at the scene providing aid until local police arrived. Sprecher relayed all information to the dispatcher until local authorities arrived and assumed control. "It sounds like the guy drove off the road through a guard rail and may have not been found had it not been for WB9ECK. It was also unknown how long the driver had been over the embankment before being found. This could have been a lot worse had WB9ECK not become involved," Sprecher said. -- Information provided by Brian Sprecher, KC9LCC

* Los Angeles County Hams Honored for Community Service: On February 27, members of the Disaster Communications Service (DCS), based at the Carson Sheriff Station, received individual and group awards from the State of California, the County of Los Angeles, the Carson Sheriff Station Support Foundation and the City of Carson, California for their participation in a wide range of both planned and emergent events. These 27 Amateur Radio operators provided almost 8000 hours of service to the agencies, including assisting in providing assistance during a bicycle race, tactical alerts due to civil unrest, funerals for fallen deputy sheriffs and the fires that plagued Southern California. Members of their Rapid Deployment Team spent five days on Catalina Island, serving as the primary means of communication between the island and the mainland until telephone systems were restored. The service provided by the Carson Station DCS volunteers saved the taxpayers of Los Angeles County almost $320,000, "but more importantly, they selflessly provided an invaluable service that is a critical component to the safety of our communities and families," the DCS coordinator said. Thirteen deputies, a firefighter, two station volunteers and two citizens were also recognized in the second annual event that pays tribute to Carson sheriff's deputies and supporters for their work in the city. More information can be found at the Los Angeles County Disaster Communications Web page <http://lacdcs.com/carson-awards-endpage.html>.

* 500 kHz Distance Record Broken Again: On February 21, Neil Schwanitz, V73NS/WD8CRT, on Roi-Namur in the Marshall Islands, received a signal from experimental station WD2XSH/6. This experimental station, operated by Pat Hamel, W5THT, is located in Long Beach, Mississippi -- 6679 miles away from the island in the Kwajalein atoll. This contact breaks the previous record for the longest 500 kHz contact. That record, set in January 2008, was for a distance of 4737 miles from Cottage Grove, Oregon to Roi-Namur. An article on Hamel's station appears in the March issue of QST. The ARRL 500 kHz experimental license, WD2XSH, was issued in September 2006 and has 20 active stations. Fritz Raab, W1FR, of Vermont, serves as experimental project manager for The 500 KC Experimental Group for Amateur Radio

<http://www.500kc.com>. Additional information can be found at the experiment's Web site and also in the July/August 2007 issue of QEX <http://www.arrl.org/qex/2007/07/raab.pdf>. -- Information provided by Fritz Raab, W1FR

* "Swiss Army Knife" Now Available for PIOs: The 2008 edition of the "Swiss Army Knife for PIOs" CD is now available. This "toolkit-on-a-disk" is designed to be a handy reference for Amateur Radio public relations officials. Topics on the disk include how to write press releases, give interviews and talk to groups; how to deal with legislative issues affecting Amateur Radio; audio, video and picture files; how to write articles for ARRL publications such as QST; how to connect with youth; information on ARRL public relations awards; how to promote Field Day in your community; FEMA course information, and more. To receive a copy, send a self-addressed stamped envelope (please make sure the envelope is large enough for a CD disk) with at least two units of postage and a note to Public Relations, ARRL, 225 Main St, Newington, CT 06111. This disk is available to anyone with an interest in spreading the word about Amateur Radio.

===
The ARRL Letter is published Fridays, 50 times each year, by the American Radio Relay League: ARRL--the National Association for Amateur Radio, 225 Main St, Newington, CT 06111; tel 860-594-0200; fax 860-594-0259; <http://www.arrl.org>. Joel Harrison, W5ZN, President.

The ARRL Letter offers a weekly e-mail digest of essential and general news of interest to active radio amateurs. Visit the ARRL Web site <http://www.arrl.org> for the latest Amateur Radio news and news updates. The ARRL Web site <http://www.arrl.org/> also offers informative features and columns. ARRL Audio News <http://www.arrl.org/arrlletter/audio/> is a weekly "ham radio newscast" compiled and edited from The ARRL Letter. It's also available as a podcast from our Web site.

Material from The ARRL Letter may be republished or reproduced in whole or in part in any form without additional permission. Credit must be given to The ARRL Letter/American Radio Relay League.

==>Delivery problems (ARRL member direct delivery only!): letter-dlvy@arrl.org

==>How to Get The ARRL Letter

The ARRL Letter is available to ARRL members free of charge directly from ARRL HQ. To subscribe, unsubscribe or change your address for e-mail delivery:
ARRL members first must register on the Members Only Web Site <http://www.arrl.org/members/>. You'll have an opportunity during registration to sign up for e-mail delivery of The ARRL Letter, W1AW bulletins, and other material. To change these selections--including delivery of The ARRL Letter--registered members should click on the "Member Data Page" link (in the Members Only box). Click on "Modify membership data," check or

uncheck the appropriate boxes and/or change your e-mail address if necessary. (Check "Temporarily disable all automatically sent email" to temporarily stop all e-mail deliveries.) Then, click on "Submit modification" to make selections effective. (NOTE: HQ staff members cannot change your e-mail delivery address. You must do this yourself via the Members Only Web Site.)

The ARRL Letter also is available to all, free of charge, from these sources:

* ARRLWeb <http://www.arrl.org/arrlletter/>. (NOTE: The ARRL Letter will be posted each Friday when it is distributed via e-mail.)

* The QTH.net listserver, thanks to volunteers from the Boston Amateur Radio Club: Visit Mailing Lists@QTH.Net <http://mailman.qth.net/mailman/listinfo/letter-list>. (NOTE: The ARRL cannot assist subscribers who receive The ARRL Letter via this listserver.)

My wife has been married before, and all three of her husbands (I am the last and longest) were hams. She never was interested in ham radio until a while back when she expressed an interest in being able to "slide into the seat" when I did emergency hospital communications. As an electrical power and instrumentation engineer of some 40 years' experience, theory was no problem for her. She started to take the three-session class offered by our radio club, using the ARRL's video tapes which in my view are insipid.. Halfway through the second tape she got up and left, declaiming "what the hell am I doing here" and strode out of the room. She never became interested again and I'm not about to press the issue.

The moral of the story - good wishes have to be backed up by solid support.

> It is not as simple as that. What constitutes an emergency?

Gee, let's open that can of worms once again!

It's a two-prong test - it has to be a situation involving immediate safety of life or property, AND no other means of communication are available.

My job at the Commish' involved reviewing such cases before Violation Notices were sent out, and in the vast majority of cases, both prongs were not met. In fact, in one notable case, the radio tech of the law enforcement agency upon whose frequency the "wanna-be" came up took the transceiver that was used to the location and was able to bring up several repeaters with "9-1-1" autopatch capability.

The ham was a "wanna-be sheriff" and the department had had quite enough of his antics. That's the situation that I referred to in my earlier message this evening.

Hello,

I'm interested in a USB oscilloscope with the hardware and software, to use with my laptop. I'd like a frequency range to 50-Mhz. I did a web search and found quite a few models. I'd appreciate some advice and suggestions on this subject. Also, are there kits or plans for building one with free software?

Thanks

The main point is that there has to be a clear and defined life-and-death emergency.

But there's also the point of who can declare an emergency? Can the EMTs say that the ambulance breakdown is an emergency?

> > OTOH, would you want to have it on your conscience

This makes it a completely different situation from the commandeering of private property.

Of course - but if someone needed them in a life-and-death emergency....

There's also the question of contract provisions as part of the rental agreement. Shoes in a locker are different from permanently installed radio equipment requiring power and radiating RF.

Of course - but what if the emergency really does meet K2ASP's double-prong test? That is, it's a real life-and-death emergency, and there are no other facilities available that can do the job?

As KB9X points out, the quoted person who said "everything we do is life-and-death" was way out of line, and not representative at all. But what about real-life situations that meet the two-prong test? Granted they are very rare, and most of us will never encounter them, but the time to think about them is before they happen.

And it really isn't that difficult IMO. The fellow who directly called the Police didn't have a need to do that, and in truth would have been better off to call 911, as they are the people with the resources needed to rescue people in that situation.

There are some good reasons to use Amateur radio in emergencies. As an example, our local repeater system is a multi receiver polling system

http://www.nittany-arc.net/newrepeater.html

that takes the poll from several sites, selects the strongest one, and relays that to the main repeater. In this way, we can cover the whole county in a manner that 300 mw can pretty well work the entire area. This is all the more impressive when you look at a topo map of Centre County PA.

Back to the reasons, if there is a deployment in the county, it can be a little difficult to establish comms from the regular systems, and in the northern parts of the county, cell phone coverage isn't easy to come by once you get away from the path that I-80 cuts through the hills.

So in the nooks and crannies of the north part of the county, our repeater is a good choice, and if there are operations in both north and south, ham radio is a pretty good choice, and fits the criteria.

I believe that in most cases, people aren't going to care a whole lot if there is a little gray area, but the "anything" description is just inaccurate and misleading.

While this may be a small minority of emergency workers who fit the "I can do anything I want to do" description, they do need their errors pointed out when they make them. According to the fellow I had the discussion with at the meeting, there would be no rules anytime.

Ambulance crews cannot authorize themselves to commandeer property; only civilian government officials can do that. The gravity of the emergency has nothing to do with it. It is just not their call to make.

Not from a property ownership point of view.

We are not the first people to consider these issues. As I said before, this is well-traveled territory. Phil's 2 prong test pertains to emergency actions on frequencies that one is not normally allowed to use. It has nothing to do with the seizure of private property. That is a topic over which the FCC has no authority or jurisdiction whatever.

Not any more than aluminum.

> The speaker (red cone is a plus) can be covered
> with leather real
> or faux. The shelves look a lot like the ones I made.

The table is homemade, too. The clock was assembled from the pieces of several, each of which had a different problem. The result has been functioning perfectly for at least 15 years.

> Tubes glow, so they are already there......

Mercury vapor rectifiers and several different kinds of VR tubes.

But see above about "form follows function" and "aesthetically pleasing without any added ornamentation". Would adding brass and leather make any difference in rig performance? Or are they only for looks?

IMHO, the form-follows-function aesthetic would brass- or nickle-plate telegraph instruments to prevent corrosion. But it would not add brass simply for a look. Same for leather - would the speaker sound better?

"Art for Art's sake"

Amateur radio is "Radio for it's own sake"

See the connection?

EXCELLENT!

Now to homebrewing some rigs....

By sheer coincidence, last night I was at Eastern University's
telescope.

Agreed. In fact, some *amateurs* may even be happy to promote
it.

> Most antennas are not ugly.

Agreed. And for those that are, the ugliness is usually
more a function of a lack of craftsmanship than it is
of the antenna itself.

For me the moral of the story is that you need to match the training to the individual. Surely someone with the qualifications you listed could simply look throug a book for an hour or two and pass the test. Sending someone that highly qualified to the sort of experience you mentioned that is aimed at folks with no background at all is not apropriate IMHO.

Jerry

Yeah, you're right on what Steampunks advertise themselves as, but that is also a small niche activity in home workshopping, not just electronics. There's much more to be found in home wood-working catalogs in regards to 'retro' design and home workshop construction.

A year or so ago, another sent me some links to old electronics, especially metrology, such as a couple of old reproductions of General Radio Company instrument catalogs. Interesting for the moment to reflect on 'style' insofar as instrumentation designed in the period of about 1880 to 1930. [the 'Victorian Era' is in the beginning part of that mentioned half-century period]

In that half-century, the high (relative) cost of instruments was coupled with a certain 'style' of 'craftsmanship' that involved very-nice, but really non-functional, wood bases and lovely 'engraved' scales and rules (more useful to the instrument) plus less useful all-purpose connector posts. To justify the high labor cost (reflected in the product cost) of working with new-fangled electrical things, the designers opted for that particular 'style' based on what could be made then but really from the (guessed) customer's preferrence for 'looks.' Usually those customers had to justify those new instruments to their funding entities (managers, academic grant givers, etc.). 'Style' is a subliminal kind of influence but any market is governed by it to sell product.

General Radio is interesting in instrument company evolution. In their beginnings there was no real 'style' and they depended on the newness of any sort of electrical standards to sell their products. It seems that GR was the first to market a ready-built oscilloscope. At least in the USA. It had a tiny screen and was built in three sections. That was in the early 1930s. In the later 1930s DuMont came out with a one-piece 'scope and larger face CRT. That became the 'style' setter for many years, was even copied by that post-WWII upstart company of Howard Vollum's called Tektronix. Vollum's designs not only improved the innards but also exterior, that which the majority classify as 'style.' With their plug-in vertical function modules Tektronix now set the 'style' and DuMont just couldn't keep up. Even HP got into competition and used the same 'style' of physical form on those...but took many years of catch-up to the clear leader of oscillography, Tektronix. GR was left way behind in oscilloscopes, giving up on that market after the end of WWII.

But, GR, now under new leadership at the end of the 1950s, got its exterior 'style' together with a 'new look.' Much more intrinsic visual appeal of form-fit-color in an instrument. They were aided by new methods of metal and plastic forming and some imagination applied realistically to that 'style.' Alas, they didn't get with the new technology intensively enough and eventually dropped out, despite the high accuracy using old technology and 'craftsmanship.'

GR had also opted to try a 'luddite' form of PR on their instrument constructions, featuring ONE technician 'doing everything' of an instrument, 'no production line methods.' Bad PR and the wrong kind of style of advertising to a customer base that was largely involved IN production. 'Style' is lots of things, not just in its outward physical appearance.

Take Hallicrafters for radios. A Biggie among amateurs before WWII and in the immediate post-WWII period. The pre-war 'style' peak might have been the SX-28 HF receiver just from appearance. Their post-war 'style' peak might have been the SX-62 Big Dial AM-FM and 'shortwave' band receiver. They, like National Radio, came out with a consumer product TV receiver and (like National) failed to penetrate the market with their 7" electro-static deflection design. Hallicrafters had a better exterior 'style' than National's wooden cabinet model but was doomed in not going towards bigger screens. Collins Radio beat both out in commercial and military equipment after WWII. Collins Radio established its own 'style' which dominated lots of aesthetic sensibilities back then. RACAL in the UK was a strong rival in that. Hallicrafters just couldn't get with the program after around 1960 and just drooped, eventually dropping out.

Market rivalry in the USA began to be taken over more and more by off-shore designer-makers around 1960. WWII was over a long time by then and off-shore production in electronics was ramping up on all markets of electronics, including amateur radio. The Big 3 (Icom-Yaesu-Kenwood) began their domination, establishing their own exterior AND interior 'styles'. Lower labor costs (and smarts) made the Japanese the leading Asian off-shore producer first, quickly followed by Taiwan and China. Their 'style' of electronics became THE style to copy, engraved in visual centers of many minds for a quarter century.

>But to return to topic, The concept of making a station conform to an
>aesthetic is not all that unusual.

I'm NOT saying that nor ever implied it. But, let's take it in context. Who or what determines a 'retro' look? And what is its appeal to certain folks?

A half-century ago ought to qualify as 'retro' to most. But how many were alive or experienced in such period radios? I was in my twenties in the 1950s but nowhere would I consider 'going retro' to a stark utilitarian environment kind of radio communications that I got started in over a half century ago. Neither does the 'style' of electronic things done in a period before 50 years ago appeal to very many. There are SOME exceptions: The Zenith Transoceanic line of portable receivers spans the pre-WWII and post-WII times with its own unique 'style' that is unmistakable. It IS attractive to so many that it has a large fan base on the Internet, several URLs, all for one model line. It has a distinct STYLE to its design.

I'm not against 'having fun' with radios. With receivers (or transceivers) one spends a LOT of time looking at front panels whether or not a user realizes that. Subliminally, at least, the appearance of a front panel, its control arrangement, colors, indications, etc., enter the visual cortex and become memory. Will added brass geegaws enter into the mind as adornement for the memory just because they look pretty at first glance?.

>Our stations can be an expression of
>ourselves, and we can either place the items on the desk and be done
>with it, or we can embellish the room as we see fit. It is just another
>way to have some fun.

I don't agree with that entirely. First of all, an amateur radio is a communications device, not an article of 'interior design.' Secondly, today's ready-built amateur radios can stand on their own as far as appearance and 'style' is concerned. That includes most peripheral equipment. OTHER people did the styling of all those, contemporaries, not some long-gone folks of another era a century ago.

Thirdly, we have to be careful about 'style influencing.' No one should dictate what or how we 'have fun' in radio other than technical requirements of radio regulation. That includes 'style' matters in my mind. Fashion styles exist to Sell More Clothes and Make More Money for clothing makers...it was not really about aesthetic appearance despite what the PR write-ups say (those write-ups are crafted to help sell those clothes). Radio equipment isn't in such a 'style' area. One either feels comfortable with a radio or not. That covers its technical performance first, appearance a second. The amateur operator will be looking at amateur radio equipment the most at any home station. If other non-radio-interested members of a household see it often, it should not (for their consideration) appear too offensive to them.

All-mechanical things are fine fun for those who like to do that. Old-time telegraphy equipment is one area well suited for such reproduction. Many amateurs like to collect manual keys. Fewer can make their own without ALSO having at least a small machine shop at their disposal. The same holds true for electrochemical treatment beyond simple PCB etching (which very few see once it has been loaded, tested, and put into equipment). I've learned to do simple tasks in all those areas but have found that working in wood and plastic basic materials is easier for hobby construction. It is simpler to do even if not flashy. I just don't have, or care to have,
a small all-purpose factory on the premises for any sort of manual construction hobby.

Now, MY likes or dislikes don't apply to others. I've been writing (hopefully) in generalities. All of electronics is generally based on FORWARD-LOOKING technologies and 'going retro' in any regard may be of momentary aesthetic appeal. There ARE devotee of equipment of a particular radio era. 'Mileage varies.'

It seems like your xyl did the same thing as my wife, only in the opposite direction. She's every bit as intelligent as me, a quick study, and she has expressed some interest, but says "I could never do the things that you do", referring to the homebrewing and design I do. I keep telling her it isn't like that at all for a majority of Hams, but so far she has not gone for it. And likewise, I'm not going to press the issue! ;^)

I suspect that what happened here is that for a woman of her abilities, the material was presented too slowly and at the level of the lowest common denominator and she couldn't stand it (too boring). She would probably have done just fine with the Question & Answer book and it's brief explanations.

I would like to see other opinions on this issue, which came up in passing in another group.

One of the participants there mentioned that a ham radio license has been added as an employment condition for some of their professional responders. Presumably the motivation is based on a desire to have a known population of people who can use ham radio technology in a disaster if nothing else is working.

I have two questions on this.

Is this a common situation? I hadn't heard of a formal requirement until it was mentioned on the other forum, but a couple more people came forward and said that it was in place in their area. Is it happening in your area?

Do you think it's a good idea?

Steve,

Where I live, middle TN, we are seeing a lot of medical, law enforcement, and emergency service types turning up in our technician and general class classes. So far as I know, none are there by requirement or "suggestion." It is just a desire to have another tool to use, and as the result of what they have seen that ham radio can and has done. In some cases, I suspect that the extent of their operating is to check in on the monthly hospital net.

It does not seem to be an unreasonable requirement for a job, given how easy the licence process is today. The rest of the hiring process will at least provide some selection of people with demonstrated responsibility. It certainly is not extraneous to most job requirements.

On Mar 3, 9:58 am, Steve Bonine <s...@pobox.com> wrote:

> Is this a common situation?

I've never heard of it before.

> Do you think it's a good idea?

No. At least not as a formal requirement for the job. I'm all for

encouraging and recruiting new hams,
and supporting them, but forcing them to be licensed as a condition of employment is not a good idea, except maybe
in certain specific conditions.

Here's why:

(insert standard "I-am-not-a-lawyer" disclaimer HERE)

One of the rules about hiring-and-firing is that you cannot make something a formal requirement for a job unless it is a reasonable part of the normal job duties. For example, if the job involves typical office work, you can't make it a requirement that an employee be able to lift a 100 pound box and place it on a shelf 6 feet above the floor unless doing so is a normal part of the job. Once in a blue moon isn't good enough.

OTOH, if the job requires that a person occasionally drive a company vehicle, having the required driver's licenses to do so is a reasonable expectation.

So if an employer wants all hires to have a ham license, one has to ask if using ham radio for communications is a routine part of the job. If it's not, then the requirement isn't reasonable. If it is, then we have to ask about the "pecuniary interest" part of Part 97.

The specific conditions I mentioned above are:

1) If a school had ham radio as part of the curriculum, and a specific teacher was expected to be able to operate the station so the students could, say, talk to the Space Shuttle. Even this is not clear-cut because a volunteer or one of the students could be the control operator.

2) If an organization like ARRL Hq or a museum needed someone to operate an amateur station as part of their normal duties (demos, bulletins, etc.)

Both of those are specifically provided for in Part 97.

The problems I see with requiring employees in other situations to be hams are:

1) It weakens the no-pecuniary-interest thing.
2) It creates a number of amateurs whose fundamental focus isn't "radio for its own sake" but rather "something I gotta do for the job". Which isn't good.

IMHO

It isn't a requirement in our area, but it is apparently strongly encouraged. This is one of the situations that I refer to as "Professional Hams". It is truly a profound change in emergency operations. I am pretty convinced that the end strategy of all this is that these groups expect to use amateur radio via their "professional hams, and will not use hobbyists in the future.

> Do you think it's a good idea?

Not particularly.

The nature of emergency work is that it only happens when there is an emergency, so people have a lot to talk and think about in between emergencies.

One of the things that emergency planners do best is impose a structure on work and situations. The problem is that structure tends to go away as soon as the emergency happens, just like battle plans.

It's why Ice trucks were left sitting in parking lots in another state when they were needed in the Katrina aftermath, its why emergency groups talk about interoperability, not realizing that the more structure they put in place, the more points for failure there will be. We seem to think that if "the boss" can see what everyone is doing and can directly command them, then all will be well. When in reality, the folks on the ground need to be able to function autonomously and be trusted to make a decision.

So instead of having trained communicators on board - note that by trained communicators, I mean people who know how to get comms across X number of miles at Y o'clock, not those who just know what to say - we'll be having professionals who happen to have a license.

Getting a Ham radio license is just an entry ticket. Are these new folks going to be able to put together a repeater system when the hurricane comes through and knocks out every other one in the stricken area? Will they wonder why they can't talk to others in the same state on 20 meters or that 75 meters seems so dead during the daytime? That is what Hams have brought to the table over the years.

I know that mine is a minority opinion, hopefully I'm very wrong!

Of course you can arrange your station to your own aesthetic 8^)

> But see above about "form follows function" and "aesthetically
> pleasing without any added ornamentation". Would adding brass and
> leather make any difference in rig performance? Or are they only for
> looks?

Well, now you open a interesting subsubject! The addition of brass to a station is one of those choices that does not necessarily defeat function. There needs to be a chassis to place components on or in. Is aluminum or steel or plastic more functional than brass? there might be some technical reasons fort one over the other, but in the end, they are a support structure. An example is the copper plated chassis found in some radios. Pretty cool. But I wonder how much "worse" they would perform if they weren't plated?

> IMHO, the form-follows-function aesthetic would brass- or nickle-plate
> telegraph instruments to prevent corrosion. But it would not add brass
> simply for a look.

Keeping in mind that fff could be used to not allow any embellishment, such as staining, finishing, we have to make sure we don't minimalize things out of existence.

side note: I once went to a classroom where a true minimalist had hung a data projector from the ceiling from wires. Problem was, the fan would push the projector, only as far as the wires would allow, and it made a pendulum. People were getting seasick!

Same for leather - would the speaker sound better?

well, possibly could make for some vibration damping.

My thoughts are to make a setup that incorporates the aesthetic in a fashion that is applicable to the situation. The equipment has to sit on something, so it will be made in a fashion that involves natural materials, and brass will be used where needed. I'm not going to remove my radios from their cases and build wooden boxes around them. I don't plan on overly embellishing the station, my goals are a warm feeling with an antique look where practical

Especially number two!

One thing I'll note there is that at least one of the new "Emergency Ops" guys in our area has become hooked on Amateur radio for it's own sake, and assuming his test last weekend went okay, is now a General, and is getting into HF mobile in a big way. He'll be an asset to the service.

So that is a really good thing, but I still worry about the "Professional Amateur" aspect

All that for the lack of one, properly placed additional wire, heh.

That's easily and authentically achieved by obtaining an old wooden desk and some genuine vintage equipment.

I have the castoff oak veneered desk from W8YX, the University of Cincinnati ARC station. It is shown in a photo of the station which appeared in a 1937 QST article about the Ohio River flood.

If I want a "thirties feel", I can fire up W4JBP's homebrew xtal controlled 6L6 rig and pair it up with an HRO, SW-3, FB-7, an RME 69 or a Hallicrafter Sky Challenger. If I want to move to the fifties, my Johnson Valiant or Central 20-A might be paired with an HQ-70 or a Collins 75A-3.

Dressing up modern technology to look as if it is powered by steam, strikes me as more than a tad silly.

No, it isn't happening in this area.

> Do you think it's a good idea?

No. I refer to N2EY's thoughtful response. I don't think it makes any more sense to make obtaining an *amateur* license part of a professional position any more than requiring an applicant for an amateur radio know how to to fight fires.

My experience does not support that, but I realize that it's MY experience and that the situation in other areas may be different. That's one of the reasons I started the thread; I am curious as to how things are in other areas. I doubt that my area is typical, but I'm not sure that "typical" even exists in this case.

I don't see our professional emergency management folks thinking that they will replace the traditional ham radio recruit, the "hobbyists" if you will. They seem to be more interested in getting licensed so that they can work more effectively with the ham volunteers, and "tap in" to the resources that are available. They see cases where hams are providing something positive and they want to be able to take best advantage of it.

Most of these professionals realize that the actual radios and the technology, while important, isn't really the most important component of what the ham radio community can provide. It's the people that matter the most. Rather than trying to minimize that, the paid emcomm folks that I have seen are trying to maximize it.

> One of the things that emergency planners do best is impose a structure on work and situations. The problem is that structure tends to go away as soon as the emergency happens, just like battle plans.

With all due respect, having an effective battle plan is key to winning a battle. They don't "go away", any more than an effective emergency plan does. Sure, things seldom go exactly as the plan would suggest, but the more planning is done in advance, the higher the probability that things will go more smoothly.

Katrina was probably the ultimate example of how Mother Nature can throw things at us that are beyond the threshold of our plans. Even so, the organizations that had invested in planning came out much better than the ones that had not.

> It's why Ice trucks were left sitting in parking lots in another state when they were needed in the Katrina aftermath, its why emergency groups talk about interoperability, not realizing that the more structure they put in place, the more points for failure there will be.

Plans are not perfect. That doesn't mean that we shouldn't plan. I am not willing to concede that ice trucks sitting in the wrong place were a result of planning. In fact, my conclusion would be the opposite -- if the plan were better, the material would stand a better chance of getting where it needed to be.

> We seem to
> think that if "the boss" can see what everyone is doing and can directly command them, then all will be well. When in reality, the folks on the ground need to be able to function autonomously and be trusted to make a

> decision.

Sure, the folks on the ground need to be able to make decisions, but the people trying to manage the big picture need to know what that decision was so that they can integrate it into the response. It's not an ideal situation when the folks on the ground MUST function autonomously because they have not the slightest idea what their compatriots are doing since they can't talk to them.

If I'm placed into the position of having to make a command decision, I'm more comfortable making that decision if I have good information upon which to base it. Without communications, that information is often missing.

> Getting a Ham radio license is just an entry ticket. Are these new folks

> comes through and knocks out every other one in the stricken area? Will
> they wonder why they can't talk to others in the same state on 20 meters
> or that 75 meters seems so dead during the daytime? That is what Hams
> have brought to the table over the years.

And I hope that they continue to do so. I just don't accept the premise that having paid members of the team as licensed amateurs changes that situation. The more that the people who are managing the disaster know about ham radio, the better they will be able to make use of the resource.

And who knows . . . some of the people might get hooked and actually grow into full fledged ham contributors.

73, Steve KB9X

Of course, it depends. For a job working behind the counter at a retail store that was, um, "geared" particularly toward ham radio equipment, parts, and supplies being licensed was a requirement. A non-ham couldn't, among other things, speak the language or have had any experience with the equipment and antennas. Besides, only the hams were partaking in the Saturday morning coffee and donuts. ;-)

In fact, I remember the newspaper help-wanted ad very specifically: "Ham radio operator wanted for full-time counter sales."

Actually I think it's the whole subject....

> The addition of brass to a
> station is one of those choices that does not necessarily defeat
> function.

Agreed - but in the Triple-F aesthetic (hereafter referred to as "The Southgate School" or TSS), not defeating function isn't enough. All choices must enhance or support functionality.

TSS also involves the use of available materials and techniques, usually from non-traditional sources. The rig pictured on my website (known as the Southgate Type 7) was built almost entirely from reused/recycled/recovered parts found at hamfests and in junkpiles. A few crystals were bought new, as was the solder, but that's about it. The main tuning capacitor is from a junked BC-221 frequency meter; the dial drum is cut from a piece of Perspex tubing 6" in diameter that came from a piece of industrial equipment, the VFO box was made (by hand - hacksaw & flat file) from scraps of 3/32" thick aluminum plate, etc., etc.

IOW, "found objects".

> There needs to be a chassis to place components on or in. Is
> aluminum or steel or plastic more functional than brass?

Depends on the application.

For things like power supplies, steel is preferred due to greater strength and some level of magnetic shielding. But steel must be painted, plated or otherwise finished to prevent rust, particularly in a basement shack where humidity may be high.

For things like transmitters and receivers (TSS does not normally use built-in power supplies because they usually decrease functionality), aluminum is preferred because of its light weight, corrosion resistance, higher conductivity and ease of working.

Brass has good conductivity and is easy to work, but it is heavy, expensive, and rarer than aluminum or steel. There is some use of brass in TSS, mostly for specialized applications where aluminum is too soft and plating or painting steel is not practical. For example in the Southgate Type 7, there is a shaft extender from the tuning capacitor which I made from brass. You don't see it but it's there.

> there might be
> some technical reasons fort one over the other, but in the end,
> they are a support structure.

Agreed. I have used wood as well, in applications where shielding wasn't important, or could be obtained in other ways.

> An example is the copper plated chassis found in
> some radios. Pretty cool. But I wonder how much "worse" they
> would
> perform if they weren't plated?

Copper plating of steel chassis (Drake is a prime example) was done for a couple of reasons. One was corrosion protection; since the steel had to be coated with something to prevent rust. Unlike most paints, copper plating is conductive, so shields and components mounted to the copper-plated chassis would make a good chassis connection. Another plus is the ability to solder directly to the chassis.

But copper plating has disadvantages too. One is that the copper tarnishes over time. Another is that any break in the plating can set up electrolytic corrosion. There's also the cost and relative impracticality of copper-plating at home.

What Drake and others did was to plate the chassis after all the holes were punched. That's fine for production-line manufactured rigs, but if there's a possibility of future changes that require new holes, the plating would be broken. So I stick with aluminum, steel, and sometimes plastic and wood.

> Keeping in mind that fff could be used to not allow any
> embellishment,
> such as staining, finishing, we have to make sure we don't
> minimalize
> things out of existence.

TSS is about simplicity and functionality, not minimalism. If staining or finishing improves the functionality, it is done. For example, the shack tabletop consists of a layer of oriented strandboard (for strength) topped by a layer of masonite (for a smooth hard surface). This combination (actually a composite) was chosen because it was the least expensive at the time. The masonite was given a couple of coats of varnish because doing so improved the functionality.

> I once went to a classroom where a true minimalist had hung a
> data projector from the ceiling from wires. Problem was, the fan

> would
> push the projector, only as far as the wires would allow, and it
> made a
> pendulum. People were getting seasick!

There's a textbook example of form *not* following function! The purpose of the data projector support is to hold the projector at the proper place so it can do its job, and if the image isn't rock-steady the appearance doesn't matter.

> � Same for leather - would the speaker sound better?
>
> �well, possibly could make for some vibration damping.

Possibly. I've had some experience building speaker cabinets (clones of the Altec A-7 "Voice of the Theater", JBL folded horns, for example) and the trick is to build solid from the beginning.

> My thoughts are to make a setup that incorporates the
> aesthetic in a
> fashion that is applicable to the situation.

Which is the basis of Triple-F. You're not far from joining TSS!

> The equipment has to sit on
> something, so it will be made in a fashion that involves natural
> materials, and brass will be used where needed.

There's the key: "where needed".

> I'm not going to remove
> my radios from their cases and build wooden boxes around them.

OTOH, wood can be a good cabinet for a rig that doesn't have one.

> I don't
> plan on overly embellishing the station, my goals are
> a warm feeling with an antique look where practical.

I've always wondered what the fascination with "antiques" is. I can understand the fascination with craftsmanship, design, practicality and materials, though.

The term I would use is "classic" or "timeless". Look at some Mission or Shaker furniture - it does not appear "antique" or dated. That's what TSS is all about, applied to Amateur Radio (and a limited budget!)

For another example, look at the classic Hitchcock film "Rear Window". Even though it is more than 50 years old, the overall look of James Stewart's New York apartment, the clothes, the cameras, and all the other details are so classic that you'd want to live there today. (Having Grace Kelly stopping by doesn't hurt either!)

Yet "Vertigo", made just a few years later by mostly the same people (Hitchcock, Stewart), looks very kitschy and dated by comparison.

Perhaps the biggest challenge is that our hamshacks are usually works in progress, rather than fully complete, so flexibility has to be designed in too.

I had a little trouble following this in that the attributions appear to
be wrong. I don't think you were really replying to yourself.

> Take Hallicrafters for radios. A Biggie among amateurs before WWII

It might have been, but there were other contenders with big, German
Silver engraved dials.

> Their
> post-war 'style' peak might have been the SX-62 Big Dial AM-FM and
> 'shortwave' band receiver.

Except that wasn't a number produced or sold in large numbers.
Hallicrafters had a number of contenders in the post war period. Some
of these include the SX-100, the SX-115, the SX-88 and the SX-42. Even
the Raymond Loewy-desgined, inexpensive S-40B would have been on the list.

> They, like National Radio, came out

> Hallicrafters had a better exterior 'style' than National's wooden

> cabinet model but was doomed in not going towards bigger screens.

Hallicrafters did not do anything special in designing the cabinet. The very same cabinet style was used in the SX-101, HT-32/32A/32B, HT-33 and perhaps one additional linear amp.

> Collins Radio beat both out in commercial and military equipment
> after WWII. Collins Radio established its own 'style' which
> dominated lots of aesthetic sensibilities back then.

Collins had two-and-a-half styles during the fifties: There was the big and clunky series of transmitters and receivers all painted in a very dark St. James gray wrinkle finish. These included the 51J series of receivers, the 75A series, a series of high power and low power AM/CW transmitters and the KWS-1 SSB high power transmitter. Then came the intermediate styling of the tiny KWM-1 SSB transceiver. That was followed by the light gray, low profile styling of the KWM-2/2A and S-Line in the late fifties.

> RACAL in the
> UK was a strong rival in that.

RACAL, jointly owned by those in the UK and in South Africa was never a contender in the amateur radio market at all. Eldico did make some Chinese copies of early fifties Collins gear which was sold to the amateur market. Many USAF MARS stations were also equipped with the Eldico stuff.

> Hallicrafters just couldn't get with
> the program after around 1960 and just drooped, eventually
> dropping out.

I don't believe that Hallicrafters was ever a big player in the military market, post WW II.

> Market rivalry in the USA began to be taken over more and more
> by off-shore designer-makers around 1960.

Japanese manufacturers did not gain more than a toe hold in the U.S. amateur radio market until about 1969 or 1970 so you're about a decade off there. Only in low-end, inexpensive stuff sold by the likes of Lafayette Radio, did the JA stuff do well. Most of their "communications receivers" weren't really that.

> WWII was over a long
> time by then and off-shore production in electronics was ramping

> of many minds for a quarter century.

WW II was only over for fifteen years by 1960. Icom was not a big player in the U.S. in other than the 2m FM game until the late seventies. Yaesu had a head start on Kenwood in SSB transceivers sold in the U.S. Kenwood (actually still Trio at the time) made some inexpensive gear sold by Lafayette and others. Kenwood HF gear didn't really start selling much until the early/mid-1970's.

I don't see "smarts" entering into the mix as much as low price. One could save hundreds of dollars on an HF transceiver made in Japan compared to the price of one made in the U.S. Early Japanese suffered from awful receiver performance. That made it possible for outfits like R.L. Drake to stay in the market until the mid-1980's. It also made it possible for companies like Ten-Tec to grow from what was essentially the producer of inexpensive QRP rigs to a maker of full featured HF rigs.

To my knowledge, no amateur radio receivers, transceivers or linear amps made in Taiwan have ever been marketed in the U.S. I believe the first HF transceiver to be built in China is the Yaesu FT-2000.

>> But to return to topic, The concept of making a station conform to an aesthetic is not all that unusual.
>
> I'm NOT saying that nor ever implied it. But, let's take it in context. Who or what determines a 'retro' look? And what is its appeal to certain folks?

There are those now marketing (Thomas) what look like cathedral or tombstone radios which incorporate AM-FM tuners and CD players. Those who buy them must like them--and I'll even go so far as to say they deserve them. They are retro in style. They just aren't authentic. I'm much rather own the real thing than some modern contrivance.

> A half-century ago ought to qualify as 'retro' to most. But how many were alive or experienced in such period radios?

I'm not certain how that matters.

> I was in my twenties in the 1950s but nowhere would I consider 'going retro' to a stark utilitarian environment kind of radio communications that I got started in over a half century ago.

When I became a radio amateur 44 years back, I used junk. That didn't mean that everyone used junk. Much of the high end stuff of that era is quite capable of doing a good job today. My Hallicrafter HT-32B uses the crystal filter method of sideband generation. It puts out nearly 100 watts and it features 1 KC readout. The Collins 75A-3 it is paired up with uses selectable mechanical filters and it too has 1 KC readout. Neither can be considered "stark utilitarian".

> Neither does the 'style' of electronic things done in a period before 50 years ago appeal

> to very many.

I dunno. One of the first things visitors to my home notice is a 1942 Philco console AM/SW radio in the living room. They ooh and ahh over it and want to know if it works. When I turn it on and let them hear KDKA rolling forth from the big speaker, they're impressed. I know of a number of businesses who'll obtain and "remanufacture" such radios on order for those who want one in their homes.

> There are SOME exceptions: The Zenith Transoceanic line of portable receivers spans the pre-WWII and post-WII times with its own unique 'style' that is unmistakable. It IS attractive to so many that it has a large fan base on the Internet, several URLs, all for one model line. It has a distinct STYLE to its design.

Well, at least *two* distinct styles. The solid state Transoceanics are quite different looking than the earlier models.

> I'm not against 'having fun' with radios.

That pleases me, Len.

> With receivers (or transceivers) one spends a LOT of time looking at front panels whether or not a user realizes that. Subliminally, at least, the appearance of a front panel, its control arrangement, colors, indications, etc., enter the visual cortex and become memory. Will added brass geegaws enter into the mind as adornement for the memory just because they look pretty at first glance?.

If I want extra brass, I'll add a diving helmet or a ships lantern. The manufactured radio equipment of the past is what it is. It doesn't need the extras.

>> Our stations can be an expression of ourselves, and we can either place the items on the desk and be done with it, or we can embellish the room as we see fit. It is just another way to have some fun.
>
> I don't agree with that entirely. First of all, an amateur radio is a communications device, not an article of 'interior design.'

I don't think that was claimed. I have a neighbor who makes kitchen cabinets with raised panel doors. He has made many a hutch or computer center with similar raised panels, all out of solid wood. I'm giving serious thought to having him make me a new operating position. The choice is mine to make. If someone else wants to set his gear up on a card table, that is his choice to make.

> Secondly, today's ready-built amateur radios can stand on their own as far as appearance and 'style' is concerned. That includes most peripheral equipment. OTHER people did the styling of all those, contemporaries, not some long-gone folks of another era a

> century ago.

I'm not one who believes that things have to match. I go for function first in my primary station. Everything else is secondary. The long ago stuff is of interest to me and I enjoy having it surround me.

Dave K8MN

there is probably a few thing gong on

firstly when you saythe batteries are 'fully' charged   are you shooting from the hip or actually measure both volts AND amps?

if not that your premise, 'batteries are fully charged' isn't prob as good as you thought

as you stated you've had these batteries over time as they age they have diminished capacity , they will not hold the amp/hr rate for as long   UNDER full LOAD while a quick voltage check or radio on test might make it appear

the things the other folks said are also true higher temp will reduce the battery life for example   , that radios also have a small draw current even when off etc

it's highly doubtful any 'xray' or other screaning machine at airports had any significant effect   millions go thru if everyone had problems we'd hear about it by now

if you want to learn about the machines and are afraid to ask the clerks just google it   btw i've never seen a machine w/o a name tag   but u do have to know where to look perhaps some were removed

all these things   added up are significant   (except luggage screaning)

what most likely happening is that the vibration of the plain caused the power switch to turn on   drain the battery   and switch off   alot of strange things happen in packing ....   removing the battery and taping over the contacts should help

otherwise i'd suspect your batteries might just be old and not up to full snuff

you'd have to make a controlled scienfitic test to be sure whats going on

best of luck and holidayz

You didn't miss anything by not trying to look it up.  The Commish' in
its infinite wisdom made the Part 15 "intentional radiator" and
"incidental radiator" requirements very complicated several years ago,
with no real thought given to analog laboratory measuring equipment
such as TDRs, signal generators, and Antenna Analyzers.

The old "100 mw input" limits apply only to certain types of devices,
and in general "intentional radiators" have to be certified for
compliance with specified antenna arrangements.

Stuff like that keeps private-sector "FCC Certification Test
Facilities" in business.

There a pile of definitions that define what the Maximum RF can be for a Part 15 device these days. Frequency is one, Intentional, or Unintentional radiation is another, Carrier, Spread Spectrum, etc. It isn't for the Faint at Heart, to figure it out.

Phil,

In practice, is there anything that can be done about uncertified (and very probably not-technically-compliant) intentional radiators?

Last year, after I bought a new car, I found that the remote-control keyfob would not work reliably (or at all) when the car was parked in a local mall's parking lot. When I sniffed around a bit with my HT, I found that there was a strong, repetitive signal on 433.920 MHz. I DF'ed to a local restaurant. The waiters at the restaurant use hand-held remote terminals, which transmit the order (by item number, apparently) back to a base in the kitchen where it's printed out by the cooks. This makes for fast and reliable service, but the base is apparently sending out a heartbeat transmission several times per second. The signal is strong enough to swamp other devices on 433.920 MHz for around a hundred yards. I can pick it up on my car rig (in SSB mode) for a couple of blocks in some directions.

One evening when I ate there I expressed curiosity and took a look at one of the handheld terminals. It has a model-number sticker on the bottom but there's no hint of a Part 15 registration number. I wrote down the manufacturer name, found their website, and also dug through the FCC Part 15 authorization database. I can't find any evidence that this device (which is imported) was ever certified under Part 15. I suspect that it's noncertified, and may have been cranked up to a power level which is beyond the Part 15 limits (and certainly seems excessive for what it's doing).

I passed the info along to my local ARRL OO, who contacted some lab guys at the ARRL... they'd never heard of this particular problem. As far as I know they didn't choose to follow up on the matter.

Since this isn't actually interfering with any licensed ham transmission I'm trying to make (but only with other Part 15 devices) I didn't feel that I really have standing to push the matter through the ARRL/OO or file a formal complaint with the FCC.

My gut feeling at this point is that trying to get the FCC to take this issue up with the manufacturer, importer, and/or customer (restaurant) is probably a waste of effort... can you hold out any hope that there's a way of dealing with the problem?

```

The device in question was a Heathkit CB walkie-talkie with a not so super regenerative receiver that I built in 1963. I suppose that radio was an "intentional radiator," but its intentions were pretty weak.... Oh, well, it led to a ham ticket.

Howard

I'm not quite sure what you mean by "inverted". ISB sidebands have the same orientation as normal sidbands, meaning the lower is inverted with regard to the upper sideband and in regard to the freqencies in the original signal, i.e., the higher frequencies in a voice are lower in RF absolute frequency although a greater separation from the "carrier".

Single sidband transmission goes back to its early use for intercontental radio links such as the telephone service from the U.S. to England provided by AT&T. I've forgotten the dates but think it was the late 1920's. The equipment was enormously complex compared to later ham SSB stuff. One of the methods used for privacy was sideband inversion applied to both sidebands, that is, the lower voice frequencies were further from the "carrier". If one had a reasonably selective receiver the signals could be heard clearly. This method was used mostly by RCA. ATT used a much more complex system which split the voice base band into several smaller bands and "shuffled" them with or without inversion. One could tell it was voice but not decipher it.

I suspect your unit would be "GrandFathered" by the rules in effect
when it was built. Phil would know for sure.....

A couple of things here: First the Terminal System "May" be covered
by a Station License issued by the FCC, in a different Radio Service.
Second, It may very well be an illegal Import, and not Certified.
Third, the Part 15 tag may have fallen, or worn off.
I had a case where a Fast Food Joint had setup their Drive-Thru Window
Com System on a UHF/Low Freq, on what was thought at the Corporate
Level, an unused Frequency in that town. It so happened, that it was the
Input for the local Sand & Gravel Dealers .25Kw Repeater, and all the
Cement Truck Drivers could hear was, "Do you want Fries with that order,
Sir?"
On Inspection, there was NO Station License Posted, and later revealed,
not even applied for. Corp. forgot and it "Slipped thru the Cracks",
Ya, Right. It was of MAJOR concern to the Sand & Gravel Company to rescue
their repeater, so I had to issue a "Notice Of Violation" unPlug the
Power Cord, for the Base Station, and "SEAL" it, and instruct the
Manager, that if the system went back on the Air, I would be back with
the Federal Marshal, and he would be going to the Gray-Bar Hotel. My Boss
got a call from some Corp. Weenie, complaining about the inspection,
how it was all a mistake, they were Sorry they lost the License
Application, that it was all the Installation Contractors Fault, it will
never happen again, Oh and by the way could we turn it back "ON" as is,
just until we can get this all straighten out?...... Didn't even get the
chance, to comment, as SHE hit the guy with a $5000 forfeiture for
UnLicensed Operation.

Just another day in the life of an FCC Resident Field Agent.....

At 433 MHz? Not very likely.

>Second, It may very well be an illegal Import, and not Certified.

In this era this is most likely. I sent the necessary contact info to
Dave off-line to get something done about this.

I've heard that song before.   Can it be played in 4 part harmony?
<ggg>

How very much Marlene. "The List" shows that she's still the RA in
Anchorage. I haven't seen her since the Big Let's-Rename-the-Field
Bureau-and-Then-Take-It-Apart conference that we attended 12 years ago
where most of us made up our minds to retire.   Are you still in
contact with her?

Bruce, it's long since been grandfathered to the landfill. :-)

No, but I did have a chance to talk to Dave, a few years back.
He was the other RA that was left after the Blood-Letting. I
understand they still work out of the Old Anchorage Monitoring
Station Site, near the Airport, but I haven't traveled up that
way for years.
Yea, she was a real "Piece of Work". I wonder if she ever got
"Called UP" as she was a Major in the Reserves, when I worked
for her. I wouldn't want to face her down, if she had a weapon in
hand....

     The TRW swap meet seems to be the only regular one in
the Los Angeles area. It was today and I was there.
Directions are on the W6TRW web site. There are occasional
treasures but also a lot of just plain trash. Get there
early, the sellers are just about gone by noon. The other
meets on the list are pretty far from the city.

I'm following a thread over in the film/TV production sound NG,
news:rec.arts.movies.produciton.sound dealing with equipment
selection and configuration for some new "reality" TV show. The
fact that these range from insipid to contemptible aside, I was
amused to note one of the equipment recommendations...

Apparently the directors/producers are using portable scanners
which are programmed to the wireless mic frequencies of the
"talent", (and with the "talent"s names programmed for display)
so that the producer/director can scan all the conversations to
find something "juicy" to send the camera crew to shoot. OTOH
perhaps it is only art imitating life where people listen to police,
fire, and other public agencies to find out what's going on. :-)

In some places (notably NYC) many audio production pros
carry computer-based wideband radios to plot local spectrum
situations in order to select reliable wireless mic frequencies.
And they are desparing at the imminent loss of the analog
TV channels (where they freuqently use narrow slices of
unused local channels for wireless mics and other wireless
functions.)

They are not alone - the entire broadcast industry is concerned about it. We (both BC people and hams) often lose sight of the real meaning of "secondary allocation".

I don't get it. Either they are safe or they are unsafe. Why would any number of batteries (say 2) be ok, but not 3. Once more it appears some rules are being made to have people "feel protected" rather than dealing with the actual problem....

The rules are made so that the technically illiterate "gate checkers"
have a bright line between "OK" and "not OK".

Lithium batteries are like little bombs. They are pretty dangerous, although unlikely to cause trouble if left alone. A few years ago, the Material Safety Data Sheets from all the manufacturers included detailed warnings about the flammability, specialized equipment needed to extinguish these things, and the toxicity of the vapors. About two years ago all of the MSDSs changed to say something like "safe for transportation" and not much else. I assume some industry pressure was brought to bear, perhaps some carriers were reluctant to transport the things.

Nevertheless, they are not completely safe. I suspect the rules are an attempt to balance the risks between the risk of the things and the reality that they need to be transported.

Possibly because two of the larger batteries as used for broadcast TV camcorders (etc) are at the limit of mass of the critical (dangerous) material. There is another discussion of this same topic over on those newsgroups (news:rec.arts.movies.production.sound, etc.)

Of course, at the other end of the spectrum, two of the microscopic batteries used in hearing-aids, etc. are a tiny fraction of the mass. But the technically illeterate gate checkers can only reliably count batteries rather than calculating the total collective mass of lithium, etc.

In September 2006, the U.S. Consumer Product Safety Commission issued recalls on many lithium computer batteries due to overheating, including instances of smoke and fire. Go to www.cpsc.gov and search for "lithium computers" (without the quotes) and you will find many such recalls. One recall notice
http://www.cpsc.gov/CPSCPUB/PREREL/prhtml06/06270.html said:

Hi folks.

>From the look of the article cited above, the noteworthy part for us hams is

"the TSA is worried about loose, spare batteries. These are batteries with uncovered electrical contacts, which, if touched by other metal objects could cause an explosion and fire during a flight"

Now, non-technical folk may well leave battery terminals exposed but I would bet that (hopefully) every ham is wise enough to cover battery terminals so they cannot be shorted together. Lithium batteries may be a (relatively) new hazard but NiCd batteries have been around for a long time and they are also a hazard if their terminals are shorted.

Happy travelling.

My only "loose" Lithium-Ion batteries are my backup camera batteries which are shipped in a snap-in plastic case that by design covers the exposed terminals, and in those cases they stay until put into service. I use similar cases from a kitchen-ware store for spare Ni-Cad batteries as well.

```

These are the number of current,
unexpired FCC-issued amateur
radio licenses held by individuals
on the stated dates, and the
percentage of the total number
of active licenses that class contains.

Percentages may not add up to exactly 100.0% due to rounding.

These totals do not include licenses that have expired but are in the grace period, nor do they include club, military and other station-only licenses.

Effective April 15, 2000, FCC no longer issued new Novice, Technician Plus and Advanced class licenses, so the numbers of those license classes have declined steadily since then.

Also since April 15, 2000, FCC has renewed all existing Technician Plus licenses as Technician. It is therefore informative to consider the totals of the two classes, since the Technician class includes a significant number of Technician Plus licenses renewed as Technician.

On February 23, 2007, the last Morse Code test element, the 5 wpm receiving test, was eliminated as a requirement.

The ARS License Numbers:

As of May 14, 2000:

Novice- 49,329 (7.3%)
Technician - 205,394 (30.4%)
Technician Plus - 128,860 (19.1%)
General - 112,677 (16.7%)
Advanced - 99,782 (14.8%)
Extra - 78,750 (11.7%)

Total Tech/TechPlus - 334,254 (49.5%)

Total all classes - 674,792

As of February 22, 2007:

Novice - 22,896 (3.5%)
Technician - 293,508 (44.8%)
Technician Plus - 30,818 (4.7%)
General - 130,138 (19.9%)
Advanced - 69,050 (10.5%)
Extra - 108,270 (16.5%)

Total Tech/TechPlus - 324,326 (49.5%)

Total all classes - 654,680

As of December 2, 2007:

Novice - 20,634 (3.1%)
Technician - 293,165 (44.7%)
Technician Plus - 21,586 (3.3%)
General - 142,579 (21.8%)
Advanced - 65,629 (10.0%)
Extra - 111,806 (17.1%)

Total Tech/TechPlus - 314,751 (48.0%)

Total all classes - 655,399

As of December 9, 2007:

Novice - 20,587 (3.1%)
Technician - 293,520 (44.8%)
Technician Plus - 21,390 (3.3%)
General - 142,608 (21.8%)
Advanced - 65,553 (10.0%)
Extra - 111,852 (17.1%)

Total Tech/TechPlus - 314,910 (48.0%)

Total all classes - 655,510

As of December 22, 2007:

Novice - 20,507 (3.1%)
Technician - 294,270 (44.9%)
Technician Plus - 21,019 (3.2%)
General - 142,713 (21.8%)
Advanced - 65,424 (10.0%)
Extra - 111,991 (17.1%)

Total Tech/TechPlus - 315,289 (48.1%)

Total all classes - 655,924

Changes:

>From May 14, 2000, to February 22, 2007:

Novice - decrease of 26,433
Technician - increase of 88,114
Technician Plus - decrease of 98,042
General - increase of 17,461
Advanced - decrease of 30,732

Extra - increase of 29,520

What the code enforcement types get vexed about is were you have two different Grounding Electrode Systems (GES) that are not bonded together into a single system. So if you have one concrete encased electrode in your tower base, another concrete encased electrode in your homes footer, and a driven rod array electrode just outside the radio room wall and you do not bond them together into a single GES that is a code violation. It is also a code violation to connect any conductor that carries power and light current to ground at any point in the wiring system that is not at the Service Disconnecting Means (SDM). The SDM is the first switch, breaker, or fused pull out that can be used to disconnect the ungrounded current carrying conductors of the wiring system from the service entry conductors. In most homes this is the main breaker or the main fuse pull out. The code name for the white wire in North American wiring practice is the "Grounded Current Carrying Conductor." In many cases it is also the neutral conductor but that is not always the case. It is that white wire that most of us call the neutral; albeit sometimes mistakenly; that must be connected to the GES at one and only one point. That point is the portion of the service entrance grounded conductor that is between the splices that connect it to the utility company's conductors and the SDM.

A practice that was very popular in the computer industry was to ground the computer equipment power supplies of main frame computers to a new and separate grounding electrode at the computers location. Connecting that ground back to the power service ground was carefully avoided on the belief that doing so would cause ground loops on the signal circuits between the main frame and the associated terminal equipment. Some self qualifying authorities recommended the same approach for radio equipment. That left the earth between the two electrode systems as the only return path for current faulting to ground at the improperly isolated ground equipment. With the resistance to earth of most driven rod electrodes being over fifty ohms the series resistance of such a fault current pathway was often over a hundred ohms. Such a high impedance would limit the fault current flowing back to the utility transformer from whence it came to a flow too small to trip the Over Current Protective Device (OCPD) protecting the faulted circuit. You then have a situation in which all of the exposed conductive parts of the radio or computer equipment is energized at 120 volts relative to earth or any body that will behave as the earth does electrically. Since it only takes about a third of an ampere to kill a human being the user could be electrocuted without ever tripping the OCPD. Because the danger to life was of a greater concern to code authorities then the difficulties caused by ground loops on signal lines the electronic engineers lost that war with the electrical engineers and the rule forbidding separate grounding electrode systems survived the attempts to remove it from the nations electrical codes.

The good news for us as amateur radio practitioners is that what is safe is also good operating practice. By bonding all of our grounding electrode systems together into a single system we get a better ground for most purposes and we greatly decrease the likelihood of equipment damage or operator injury / death.
--
Tom Horne

"This alternating current stuff is just a fad. It is much too dangerous for general use." Thomas Alva Edison

Changes followed by "|".

Welcome to rec.radio.amateur.moderated! This is a moderated newsgroup for amateur radio operators and other people having an interest in the Amateur Radio Service, as defined by national regulations and international treaties. Following are the posting guidelines for this

newsgroup.

This message includes the following sections:

1. Topics and posting policies from the rec.radio.amateur.moderated Charter
2. Additional posting guidelines
    2.1 Netiquette guidelines
    2.2 Posting form requirements
    2.3 Guidelines on signature (.sig) files
    2.4 Guidelines on excessive quoting
    2.5 Guidelines on pointers to outside sources
    2.6 Guidelines regarding questioning someone's suitability to hold an amateur radio license
    2.7 Guidelines regarding name-calling
    2.8 Guidelines regarding civility
    2.9 Other unacceptable topics

----

1. Topics and posting policies from the rec.radio.amateur.moderated Charter

rec.radio.amateur.moderated is an inclusive on-line community of amateur radio operators and other people having an interest in the Amateur Radio Service. Participants are invited to engage in open discussion of amateur radio issues and exchange information about participating in the hobby/service, in an atmosphere of civility, friendship, and fun.

Acceptable topics include but, are not necessarily limited to, questions and discussions about amateur radio licensing, regulations, tips on various aspects of setting up an amateur radio station, and sharing operating experiences and insights.

Unacceptable posts include, but are not limited to, buy/sell/trade posts, posts that are off-topic to the Amateur Radio Service, posts promoting or defending unlawful activities, etc. Crossposts of regular discussion articles between rec.radio.amateur.moderated and other discussion newsgroups are not permitted.

Frequently-Asked-Questions lists and other information/bulletin/ announcement postings may be crossposted to rec.radio.info, rec.answers, and news.answers only with prior approval of the moderators of those newsgroups. In all such cases, an appropriate "Followup-To" header, containing only rec.radio.amateur.moderated, will be added by the moderators if one is not already provided.

Posters are encouraged to state their own views and share their experiences, but to refrain from making assumptions about the motivations of other newsgroup participants. Posters are expected to maintain a basic tone of civility. Prohibited uncivil discourse includes, but is not limited to, name calling.

Posts containing unsolicited advice questioning the right, worthiness, suitability and/or readiness of any individual (or members of any group) to be an amateur radio operator are unacceptable in this newsgroup. If an individual chooses to post asking for advice on when or whether to obtain an amateur radio license, or to participate in any type of lawful activity in the Amateur Radio Service, respondents should be careful to address their comments only to the original poster and not explicitly generalize to others in similar situations.

Similarly, posts that arbitrarily declare certain classes of amateur radio licenses, or certain members of national amateur radio societies (e.g., American Radio Relay League, Radio Amateurs of Canada, Radio Society of Great Britain, Wireless Institute of Australia, etc.), to be more or less worthy than others, are not permitted. Posts that politely encourage individuals to join their local amateur radio society, or to upgrade to higher classes of amateur radio license in order to enjoy greater operating privileges, are permitted, however. Posts that contain reasoned, civil, and fact-based discussion of the activities and internal politics of national amateur radio societies are also permitted.

Buy/Sell/Trade and Commercial Policy:

Posts containing offers to buy, sell, or trade are not permitted on rec.radio.amateur.moderated. The rec.radio.swap newsgroup was created for this purpose, and should be used instead. All such articles will be rejected by the moderators with the advice to re-post to that newsgroup.

Postings that are entirely commercial press releases, advertisements, or other public relations campaigns will not be permitted. Relatively unbiased announcements or reviews of new amateur radio-related products or services may be permitted at the discretion of the moderators. Such posters are asked to disclose their financial or professional interest, if any, in such products or services.

---

2. Additional Posting Guidelines

2.1 Netiquette guidelines

Participants who are new to Usenet should familiarize themselves with the "netiquette" of Usenet as well as the particular posting guidelines for this group. Several useful posts for "newbies" can be found on the newsgroup news.announce.newusers or on the WWW at:

http://www.faqs.org/faqs/by-newsgroup/news/news.announce.newusers.html

Particularly helpful articles are:

- Welcome to Usenet!
- Rules for posting to Usenet
- Hints on writing style for Usenet
- A Primer on How to Work With the Usenet Community
- Emily Postnews Answers Your Questions on Netiquette

2.2 Posting form requirements

Any article that falls into any of the following categories will be automatically rejected:

A) Articles that contain original text of more than 75 characters per line
B) Crossposted articles to newsgroups not included in these Guidelines
C) Articles that contain more than 400 lines
D) Encoded binary files (except PGP and other short digital signatures)
E) Attachments to posts
F) Articles containing obscene language
G) Articles from individuals who have been suspended or banned from the newsgroup

2.3 Guidelines on signature (.sig) files

Many people close each article they write with a few lines of common text. This may be a cute quip or quote, or may include information about their family, contact information, or disclaimers required by their employer, for example.

Signature files used on rec.radio.amateur.moderated posting must be no longer than 8 lines.

The content of a poster's signature need not be relevant to amateur radio, but it must not violate any of the other posting guidelines. (For example, name-calling that would not be acceptable in the body of a message is also unacceptable in a signature.) Posters may include Uniform Resource Locators (URL's) and business addresses in signature files, provided they comply with all the other guidelines regarding signatures.

2.4 Guidelines on excessive quoting

Posts more than 20 lines long that also have more than 75% quoted text will be carefully reviewed by a moderator to determine if that degree of quoting is warranted. Posts with excessive quoted text may be rejected.

Posters must show a reasonable effort to trim the post they are replying to and to include just enough material to establish context. "Me too!" posts are discouraged, and, when posted, must edit the quoted material significantly.

2.5 Guidelines on pointers to outside sources

Unsolicited announcements and pointers to web sites that are strictly commercial press releases, advertisements, or other public relations campaigns, are not permitted. However, a pointer to a website or other external source of information is permitted and encouraged in cases where it is relevant to an existing thread, with appropriate context being given in the post. A URL with no information about what a user should expect to find there will be rejected. A pointer to information that is off-charter for rec.radio.amateur.moderated will be rejected, as will a pointer which itself does not meet the rec.radio.amateur.moderated guidelines (such as a URL containing embedded name-calling).

Moderators are not responsible for verifying the contents of any external information source.

2.6 Guidelines regarding questioning someone's suitability hold an amateur radio license

Identifiable groups and individuals may not be asked/told/etc. not to obtain an amateur radio license, or to only obtain certain classes of amateur radio license. It is not permissible to make statements that a person or members of a specific group "should" not, or should not be allowed to, become an amateur radio operator.

Solicited advice of this type is permissible; however, posters must be careful not to explicitly generalize to others who are in some way "like" the poster asking the question. Stick to the individual asking for advice.

It is acceptable to discuss verified violations, documented in criminal convictions or other government enforcement actions, by a person or members of a specific group.

2.7 Guidelines regarding name-calling

Nastiness addressed at a person is considered name-calling. Criticizing a person's *actions* is not, provided that it is done in a civil manner.

Attacks on an action which by their very nature include an accusation against the person's character are not acceptable. For example, "That's a lie" implies an intentional prevarication, and is considered name-calling. Acceptable ways of questioning the truth of a poster's statement include the more tactful "I don't think that's true," "I believe you are mistaken because..." or even simply "That's not true." "That's not true and you know it" crosses back over into name-calling, however.

2.8 Guidelines regarding civility

By charter, posters are expected to maintain a civil tone in all their postings. The guidelines on name-calling cover part of that requirement, but not all of it.

In general, posters are expected to consider the reputations of other participants, and refrain from making unnecessary accusations or assumptions about the motivations of others. A good rule of thumb is to phrase your comments as your opinion -- "I think..." "It seems to me that..." "This makes me wonder whether..." etc...

Posters are expected to make factual claims, to debate topics openly and in good faith, and to accept honest criticism, all without provocation or prevarication. At least one professional organization, the Institute of Electrical and Electronics Engineers (IEEE), has recognized that such fair dealings are necessary components of ethical conduct, and has incorporated them into its Code of Ethics:

http://www.ieee.org/portal/pages/about/whatis/code.html

Though the Amateur Radio Service is not a professional endeavor, the moderators strongly feel that the IEEE Code of Ethics is also a worthwhile set of guiding principles for participants in the rec.radio.amateur.moderated newsgroup.

Posters are not required to support the American Radio Relay League (ARRL). However, they are expected to adhere to the spirit of the other parts of the ARRL's "Amateur's Code":

http://www.arrl.org/acode.html

2.9 Other unacceptable topics

Participants are reminded that the charter also prohibits posts promoting or defending unlawful operating practices.

Posts may discuss whether operating practices are unlawful, or engage in reasoned debate over why certain operating practices should or should not be unlawful. Posts may discuss enforcement actions, such as by the Federal Communications Commission in the United States or similar government agencies in other countries, and evidence gathered by parties such as Official Observers in support of complaints about unlawful operation.

Discussions of what practices constitute unlawful operation in the Amateur Radio Service should be limited to *factual* descriptions of the laws in various jurisdictions. Posters' *opinions* as to what practices they consider unlawful are not permitted. In particular, posters are cautioned not to extrapolate their country's laws and regulations to those in other parts of the world, as they may be quite different.

Posts that entirely concern themselves with other radio services or hobbies, such as Citizen's Band, General Mobile Radio Service/Family Radio Service, and Scanner or Shortwave Listening, are considered off-topic to the rec.radio.amateur.moderated newsgroup. Newsgroups such as rec.radio.cb, rec.radio.scanner, and/or rec.radio.shortwave may be more appropriate venues for such posts.

Posts that attempt to publicly criticize moderators or moderation |
decisions in the newsgroup itself are also not permitted, as stated in |
our original newsgroup charter. Please direct any such critical |

```
feedback to our administrative contact address at the bottom of this          |
article, where it will be carefully considered by an appeals team of          |
moderators.  This team is distinct from the initial team of moderators        |
that approves or disapproves article submissions, and thus can provide        |
independent oversight of moderation decisions.                                |

Similarly, if you see an obviously inappropriate article in our               |
newsgroup, please assume that it was a mistake or a direct forgery.  The      |
moderation team makes every effort to protect the newsgroup from such         |
incidents, but they do happen, albeit rarely.  You may also submit            |
feedback to the same address regarding such articles in our newsgroup,        |
but it is likely that our monitoring software and procedures have             |
already detected it, and we are actively handling the problem.  Please        |
resist "piling on" with followups to the newsgroup when these incidents       |
occur, so that we don't have to reject such articles.                         |

Please direct any comments, questions, or criticisms about this article
to rec-radio-amateur-moderated-request@panix.com.

Not a bad idea at all, but some caveats are in order.

The ARS would be a communications avenue that you and your fellow firefighters could use if your normal assigned communications fail. That would be how I would approach it to your board of directors. It's not a bad idea, but here come the caveats.

There has been a misconception among a lot of emergency service providers that the ARS is going to be another tool in their belt. IOW, all the employees are going to get their Technician license, and will use the local repeater in their work.

We'd seen a this in our area, where some folks who have no interest in Amateur radio, or any kind of radio for that matter, have come in and started telling us what we have to do.

We've been working hard at trying to get everyone on the same page here. It hasn't been easy though. We run into a lot of "Everything we do is a matter of life and death, so by definition, we can priority use your system at any time we wish." That is one of those things that is true on a very broad scale, but not true in the details.

In other words, don't try to sell them the idea that Ham radio is going to be a back channel for the department, or that this is new communications channels that are opening up for them. It's for emergency use only, (when operating as you are working) and used in its proper place.

Note this isn't to say that the new hams can't get on the repeater and chat like the rest of us do!

And the other half of the equation is "when there are no other means
of communication available".  That includes other radio channels,
cellphones, landlines, and (figuratively) smoke signals.  Very few
instances of claiming the exemption turn out to be justified.

Xref: g2news1.google.com rec.radio.amateur.moderated:2102 uk.radio.amateur:141680 aus.radio.amateur.misc:10444 rec.radio.info:655

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

Consistent with rec.radio.info's past usage and message traffic, we had resumed collecting and aggregating many popular weekly amateur radio bulletins and crossposting them to the newsgroups. We selected bulletins that were available via E-mail or Web page, had reprint/relay permission, were in the English language, and could be automatically gatewayed to the newsgroups in plain text. These included:

AMSAT Weekly Satellite Report (Amateur Satellite Corporation)
AMSAT News Service Weekly Bulletins (Amateur Satellite Corporation)
WIANews (Wireless Institute of Australia)
DXNL (Deutscher Amateur Radio Club)
IRTS Radio Bulletin (Irish Radio Transmitters Society)
GB2RS News (Radio Society of Great Britain)

SARL News in English (South African Radio League)
The ARRL Letter (American Radio Relay League)
Amateur Radio Newsline (Newsline, Bill Pasternak)
RAC Bulletin (Radio Amateurs of Canada)

(The Ohio/Penn DX Bulletin had continued to be directly posted, via prior arrangement and authorization, during the absence of an active moderation team.)

The original charter of rec.radio.info:

http://www.faqs.org/ftp/usenet/news.announce.newgroups/rec/rec.radio.info

was to serve as a crossposting target for information bulletins, newsgroup charter announcements, and newsgroup Frequently-Asked Questions (FAQ) lists. Implicitly, that rec.radio.info should not "steal" articles from other newsgroups, or require readers to know that rec.radio.info exists and that all bulletins/FAQ's/etc. have been redirected to it. It was also potentially awkward (possibly rude) for us to redirect followup discussion from the FAQ's/bulletins to a newsgroup where the original root article of the thread wasn't posted in the first place. Also, as indicated by its place on the namespace hierarchy (rec.radio.*, not rec.radio.amateur.*), rec.radio.info was not intended to be just an amateur radio newsgroup. Other newsgroups' bulletins that were intended to be crossposted included rec.radio.broadcasting, rec.radio.shortwave, and rec.radio.scanner.

When an article is simultaneously crossposted, only one article is propagated over the networks, and most newsreaders should show it only once. In this way, the rec.radio.info newsgroup becomes an information concentrator of articles that already exist in the news spool, not contributing extra bandwidth or duplication, much like rec.music.info or news.answers. It was also felt that a good test of whether a bulletin was worthwhile to post to the newsgroups was whether or not it was tolerated in a subject-specific "home" newsgroup. When we took over the newsgroup in February of 2007:

http://www.big-8.org/dokuwiki/doku.php?id=nan:2007-02-23-rec.radio.info-announce

we originally sought to continue both the letter and intent of the original charter.

In cooperation with the rec.radio.amateur.moderated newsgroup and moderation team, we chose that newsgroup as the principal crossposting target for general amateur-radio related bulletins. Some members of that moderation team felt that crossposting the bulletins, and allowing followup discussion, could serve as useful discussion starters for their new newsgroup. Due to their size, frequency, and special interest topic, the AMSAT bulletins continued to be crossposted to rec.radio.amateur.space only. The DXNL bulletin was also crossposted to rec.radio.amateur.dx. The country-specific bulletins that had their own country-specific newsgroups were also crossposted to those newsgroups (aus.radio.amateur.misc for WIANews and uk.radio.amateur for GB2RS

News).

We commenced a 90-day test of relaying the bulletins, from March to May of 2007, and considered both internal and external feedback. There were no internal objections, though about half of the moderation team wanted a disclaimer at the bottom of each bulletin (to supplement the disclaimers already in the headers of each approved message for the moderated newsgroups). We only received one external objection, from an individual who felt that the ARRL Letter was more of a public-relations and advertising message than a true news bulletin.

Concluding that we had readership support for relaying these bulletins, we then continued to post these bulletins, and as simultaneous crossposts. Starting around October of 2007, the rec.radio.amateur.moderated Moderation Team started to have internal discussion about whether crossposting bulletins to rec.radio.amateur.moderated was worthwhile. Some felt strongly that if posted, they should be posted to rec.radio.info only, and not any other newsgroup, with followups directed either to poster, or possibly even to a newsgroup for which the bulletin was not originally posted. This would be a change of charter for rec.radio.info. Because of this, we decided to have a 90-day test and moratorium, from October 2007 to January 2008, where we would not relay the bulletins and see if anyone noticed or complained. We received no external feedback regarding these bulletins during that time, nor did anyone complain about their absence.

Since our two 90-day tests, one with the bulletins, and one without, were inconclusive with respect to reader feedback, we would like to now explicitly solicit reader feedback at this time in order to make an appropriate decision about the format and target newsgroups of any relayed bulletins. Examples of feedback that would be useful to us would include answers to the following questions:

- Do you read the bulletins?

- Which bulletins do you read?

- Which bulletins, if any, do you feel have inappropriate advertising or public relations content for posting to the newsgroups?

- In what newsgroup do your prefer to read the bulletins first, or read them at all (subject-specific, rec.radio.info, or none)?

- Would you read the bulletins if they were posted to rec.radio.info only?

- Would you be interested in initiating followup discussion based on the contents of the bulletins? To which newsgroups? Via E-mail to the originators?

- Would you be able to follow any followup discussion that was directed to newsgroups other than to which the original bulletins were posted?

We would be most interested in hearing about how *you* personally have read, or intend to read, the bulletins on the Usenet newsgroups, and intend to submit followup discussion (or not). Speculation or demands concerning how others "should" or "should not" read or react to the bulletins would be much less helpful to us. In particular, we wish to avoid expending a lot of ongoing effort to relay bulletins that will be substantially ignored, or shunted off to newsgroups that are not widely read.

Please respect the "Followup-To: poster" line and direct all feedback via E-mail to the Reply-To: address of rec-radio-info-request@panix.com.

Consistent with their newsgroup charters, followup discussion posts on this subject made to rec.radio.amateur.moderated or rec.radio.info will be rejected.

Thanks in advance for any thoughtful feedback on this subject. Such feedback will weigh strongly on our decision how to proceed in the future.

--

So I listened for the moonbounce echoes on 6792.5 kHz this weekend.

With a Kenwood R-2000 and a random wire, with a significant (s3-s5)
local
noise level, I was able (barely) to hear the reflected signals.

There was much fading.   I note this in others reports as well.

I understand the mechanism (I think...) for fading with normal sky-wave.
How is the QSB explained on a direct signal from/to the moon?

Does the effective path length through the upper atmosphere actually
vary
by as much as 1/2 wavelength? When moving directly up through the
atmosphere?

What's the story?

Regards
PN2222A

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group every month. You are now reading the first article, which explains what rec.radio.info is, and answers some Frequently Asked Questions. The second article is titled Posting Guidelines, and you only need to read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next " -- " string. The sections available are:

- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit chat about radio. Rec.radio.info will contain informational, factual articles only. Follow-ups are redirected to an appropriate other group, and further discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propagated across the net). This tag also facilitates a pre-existing method of dropping or canceling the articles locally within the discussion groups if you don't want to see

them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

```
/Newsgroups:.*[ ,]rec\.radio\.info/h:j
```

either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

```
rec.radio.info:!s/:^
```

in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

```
sequence
rec.radio.info
rec.radio.
```

at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

More information about kill files may be obtained from Dave Fawthrop's Killfile FAQ at:

http://www.hyphenologist.co.uk/killfile/

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, we will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for discussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is the rec.radio.amateur.moderated Moderation Team. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@panix.com

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

rec-radio-info-request@panix.com

But before you do so, please be sure to check out the "Posting Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. We receive information in our mailbox; we then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you

might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

   rec.radio.swap may be more deserving of the posting in any matter.

   Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, We would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. We reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all we can allow.

 -- I do not have access to news, how can I get the information posted to rec.radio.info?

Google has an excellent web interface to Usenet newsgroups. It is available at:

http://groups.google.com

It supports both reading and posting.

Another excellent web interface to at least the radio-related Usenet |
newsgroups is the RadioBanter site: |

http://www.radiobanter.com |

sponsored by the NewsgroupBanter project: |

http://www.newsgroupbanter.com |

It, too, supports both reading and posting. |

 -- Will the material appearing in rec.radio.info be archived somewhere? |

Yes. See Google Groups and RadioBanter above. |

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

 -- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires co-operation and goodwill to be beneficial to the community in the rec.radio hierarchy.

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

Changes followed by "|".

*** rec.radio.info - Posting Guidelines and Etiquette ***

Two introductory articles about rec.radio.info are posted to this group and to rec.answers/news.answers every month. You are now reading the second article, which explains how to submit something to rec.radio.info, and which answers some Frequently Asked Questions about the submission process. The first article is titled "Welcome to rec.radio.info", and it might be a good idea to check it out as well.

-- How do I submit something to rec.radio.info?

Two possibilities. You can use your newsreading software to just post the article to rec.radio.info, as you would do with any other newsgroup. The difference is that the software recognizes the special status of rec.radio.info as a moderated group, and will e-mail your article to us, the moderation team, instead of posting it to the group.

Alternatively, you can mail your article directly to us at the following address:

rec-radio-info@panix.com

Mailing us directly is probably (a wee bit) faster, but using the transparency offered by the newsreading software is probably more convenient.

If you have any questions, or wish to deal with some administrivia with the moderation team, we suggest mailing to the following address:

rec-radio-info-request@panix.com

-- How soon will I see my article appear?

It depends on how busy we are. Your article reaches us as mail, we have to read it first, give it the stamp of approval, and finally send it on to the group. We will attempt to read and decide on all submissions within 72 hours at the very least, though we will probably be able to process submissions much faster in actual practice.

The site from which we moderate this newsgroup, "Public Access Internet and Unix, NYC" (Panix), is directly connected to the Internet, and articles posted at that site should appear at most major news sites, including Google Groups, the same day. The principal delay, therefore, will be the wait in the moderator's submission queue.

If you post a periodic article, and have shown to be trustworthy, we may allow you to post directly if the article is of a timely nature. See the section below on direct posting.

-- Should my article be in a specific format?

No. If it is not totally illegible, we will accept it, and if it does not have a correct subject-line we will correct it with your permission -- that's what a moderator is for.

However.

You could do us a big favor by making sure your article conforms to these simple requirements:

1) The article must present information, not discussion or requests, We will reject the article or require you to change the wording if it is worth it.
2) A good, descriptive Subject line.
3) Always mention what source you got the information from.
4) Don't forget to include a Followup-To header, at least if you don't want further discussion to automatically be forwarded to you, the poster, which is the default if the article is only posted to rec.radio.info.

As we said: if your article is appropriate we will post it even if you don't follow these guidelines, but then don't blame us for not processing it immediately. 'Perfect' articles we can send on with a couple of keystrokes. Stuff that needs minor editing is going to have to wait until we have time to do so.

Please do not waste both our and your time by posting requests, as this is an information only news group.

-- What about crossposting?

If you send something to rec.radio.info, just name any group you'd like to cross-post to in the Newsgroups field. Then, when we approve the article for rec.radio.info it will get automatically cross-posted to any other groups mentioned. This will also override the default Followup-To: poster, replacing it with the groups you cross posted to.

We would prefer if the group be cross-posted to the various discussion groups in the rec.radio.* hierarchy that are appropriate:

rec.radio.amateur.misc	Amateur (ham) radio and related matters
rec.radio.amateur.packet	Amateur Packet Radio discussions
rec.radio.amateur.policy	Amateur Radio practices, rules, etc.
rec.radio.noncomm	Non commercial radio discussions
rec.radio.shortwave	International broadcasting on the 'HF' bands
rec.radio.cb	Citizens Band (27 MHz) discussion
rec.radio.scanner	Scanner discussions (unsupported group)

or in one of the moderated groups:

rec.radio.amateur.moderated	Amateur radio practices, rules, etc.
rec.radio.broadcasting	Discussion of *domestic* radio broadcasting

We will leave it up to the poster to decide which group(s) are appropriate, but reserve the right to add groups if we feel it has broader interest. We will consult with the poster first.

Notes on crossposting:

- rec.radio.broadcasting is also a moderated group. The rec.radio.broadcasting moderator prefers to review all articles himself before posting. Placing rec.radio.broadcasting before rec.radio.info on the Newsgroups line should accomplish this. We will typically abide by the rec.radio.broadcasting moderator's decision whether the article is appropriate for rec.radio.info.

- rec.radio.amateur.moderated is also a moderated group. As the rec.radio.amateur.moderated Moderation Team manages both rec.radio.amateur.moderated and rec.radio.info, we can manage crossposting and approvals for both newsgroups. The rec.radio.amateur.moderated group does not allow crossposting to other discussion newsgroups, whether moderated or unmoderated. However, we would like to manage rec.radio.info as consistently as possible with how it was done by previous moderators, including the grandfathering of existing regular postings. Therefore, the submitter can choose rec.radio.amateur.moderated or the other unmoderated rec.radio.amateur.* discussion newsgroups for crossposting, but not both.

- Any FAQ or informational posting approved by the rec.answers/news.answers moderation team that is also crossposted to any rec.radio.* newsgroup (besides just rec.radio.info) is also automatically pre-approved for rec.radio.info. See below for more information.

If you post to another moderated group, it may be better to make special arrangements with both moderators before posting by contacting us at our administrivia addresses.

In addition, cross-posts do not take up extra space; modern newsreaders can be configured to show you cross-posted articles only once anyway; not everybody reads rec.radio.info; and rec.radio.info was never meant to reduce the volume of the regular discussion newsgroups. But keep in mind that some of the mail gateways may filter out the informational postings (at request of the subscribers) to keep the load down.

You decide.

-- I have a regular posting with timely information, can I make arrangements to help speed up delivery by posting directly from my site?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires cooperation and good will to be beneficial to the community in the rec.radio.* hierarchy.

If you are currently maintaining (or plan to maintain) a radio-related periodic information posting, you may wish to consider crossposting it to rec.answers/news.answers. Postings that are approved by the rec.answers/news.answers moderators for this treatment are automatically pre-approved for crossposting to rec.radio.info (as the news.answers requirements are far more rigorous than the requirements this newsgroup ever plans to use). For more information about this option, consult the appropriate information articles and posting guidelines in rec.answers/news.answers.

Realize also, that even if your post is not approved for rec.answers/news.answers, it can still be approved for rec.radio.info. The intention is not so much to get every last bit of radio-related information on rec.answers/news.answers, but rather to provide an alternative avenue of approval (as well as grandfather existing maintainers of radio-related information and spare them additional bureaucratic hurdles). Again, crossposting to either rec.radio.info or rec.answers/news.answers, both, or neither, is at the discretion of the poster (subject to the approval of the moderators). You decide what is most appropriate for your article.

Please remember that as an information maintainer, you are not alone. There are many others on the net who maintain and post periodic information postings, using various intermediate-to-advanced features of Usenet (usually via automated tools). Various degrees of technical support and general hand-holding are available from many Usenet veterans. Send us some E-mail describing your needs to our administrative address below, and we'll try to help, or at least refer you to the right knowledgeable individual(s).

-- And Follow-ups?

If the only newsgroup you have specified is rec.radio.info, then the Followup-To: field will always be set to poster. If you do not want this, you must supply a Followup-To line of your own, and we will honor that one, as long as it is a subset of the original Newsgroups line.

If you specify newsgroups to cross-post to, then the Followup-To field will be set to include all the cross-posted groups, excepting rec.radio.info itself. Again, if you do not wish this behavior, supply your own Followup-To line.

We maintain other standards on the various RFC-1036 (news transport) header lines. For example, if the article is appropriate for passing into the Packet Radio Information Network, we encapsulate the Packet Bulletin Identifier (BID) in the Message-ID: news header line indicating the machine of origin as the ampr.org domain:

```
 Message-ID: <$opa.55.1994@ampr.org>                                   |
```

where the Packet Radio BID, in this example, is `$OPA.55', and it was posted in the year 1994, because some of the Bid numbers are cycled yearly. Hopefully, this can be used as a key to re-introduce the articles for the Packet Radio network. Also, if the article is a repost of an already existing information article in the rec.radio heirarchy, we ensure that the References: header line is linked to that previously posted article. This also helps to tag articles, and may be used for additional filtering if needed.

Since the articles are archived, please use the Summary and Keywords header lines to help one search for your article.

-- Why have I received no reply from you?

We never reject anything in silence, and we make a point of it to answer all our mail. However, E-mail, like a brain cell, can and does get lost, every now and again.

So, if you send us something, and you don't see it appear it rec.radio.info, and you still have not heard from us in reply after say, five days, you can be pretty sure that either your mail never reached us, or that our answer has never reached you. In that case, please try again (We will filter out duplicates).

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

For that matter so are plain old 9volt transistor batteries. Since both terminals are at one end there is some danger of their shorting if you carry a battery in your pocked with change or keys and no protection over the terminals. I don't think a 9V alkaline battery would explode but they get hot enough to hurt you.

Hot enough to hurt is a few orders of magnitude below the danger posed by lithium batteries. Lithium batteries burn with an extraordinarily hot fire which cannot be extinguished by normal fire extinguishers. In addition, the combustion products are highly toxic.

Lithium ion batteries are a lot safer than the original lithium batteries.

The problem of exploding batteries is one that we have inadvertently brought upon ourselves. A good example is laptops, as we clamor for ever smaller laptops, (Darn, that new Apple "Air is cool) and batteries that last longer and longer, the manufacturers are kind of forced to go to higher and higher energy densities to pack power into less and less volume.

As energy density increases, so does the excitement of any related failure.

And yet I think that the typical customer thinks that since it is smaller, it must use less power. Kind of like how a lot of people think that since highway driving nets better gas milage than in-town, that traveling 80 miles per hour must give you better gas milage than traveling 55. Logic, but bad logic nonetheless.

The battery rules are actually very good ones. See below.

I don't think a 9V alkaline battery would explode
> but they get hot enough to hurt you.

I have felt that warm and fuzzy feeling from carrying a 9 volt battery in my pocket with some loose change. You can bet I don't do that any more.

Along similar lines, a few years ago, I bought one of the early lithium (not LI ion) batteries in 9 volt form. There is a battery that should never have been made!

As if the average TSA screener knows (or cares about) the difference. Another version of examining the innards of everyone's shoes because some idiot thought that he could conceal explosives in his.

Maybe I'm lucky but I've never had overheat problems with any of my Li-Ion batteries.

When in doubt, check the FCC/WTB site. No guarantee of accuracy or
even of being there.

And don't forget that "safer" doesn't mean they are safe. Loose batteries are just not acceptable among polite company! Or anywhere else for that matter. I supposedly know about these things, and yet I once put that 9 volt battery in my pocket.

For all the grief screeners take, this is a good ruling. It should have been around a long time ago.

I'm sorry - I did find out that it's no longer available on the public ULS lookup site but the WTB does keep those statistics. You may want to call the FCC/ULS Customer Support Hotline - 1-877-480-3201 - and ask. them.

If you want information about a specific license, it is available for public lookup on the ULS.

Hello all -

I am looking for a replacement fiber optic cable that was used in the ICOM IC-901A/E multi-band radio system.

The ICOM Fiber Optic Cable part numbers that will work are: OPC-172, OPC-172A or OPC-189.

I have looked at the manufacturer's site and talked to their support staff, they are no longer stocking or supporting these parts. I have also looked on e-Bay and several other sites without success

If someone knows where I might find any of these part numbers, either new or used, I'd be grateful.

Thanks for any help.

Gary Waldeck, K6AIR

Gwaldeck (at) ix (dot) Netcom (dot) com

Yea, I failed to mention that the station trustee and I are both the
same license class.

Under no circumstances can one operate outside of his/her privileges while acting as the control operator and I wouldn't want to give the impression that one can just ID with the club ID and consider themselves an "extra for the day" by virtue of being in the club shack. Now if somebody is there with them they can extend their operations to include the highest licensed ham present, but the highest license present then becomes the control operator and communications outside of one's privileges becomes third party communications if I'm reading the rules correctly.

I think I'm going to put a section in the operating manual for the shack that explains all this. Just to keep the raft of newbies coming in from making any mistakes that brings us to the attention of the FCC enforcement guys.

LORAN "C" still exists* but LORAN "A" has been eliminated. It was LORAN A that used part of what we call the 160 meter band.

* But just barely exists, at that. Take a look at a marine electronics catalog. The only LORAN-related product that I was able to find by searching an on-line catalog was a replacement antenna that was made by Shakespeare. You would think that the flat panel multifunction displays (depth, RADAR, fish finder, moving map, etc.) would have LORAN as an option, to back up GPS, but it appears to me that they do not.

I'm the trustee of several club stations (all under one call sign) and NOBODY "borrows" those stations!

Next time ask a communications attorney who specializes in

interpreting FCC rules. <ggg>

>exception of Field day and contesting at the clubhouse, I ID as my call.

Really, Mike!    The station is IDed with the station licensee's call
sign.  The only time that the call sign of the operator is used is if
the privileges of the op are greater than the privileges of the
station licensee and the op is exercising those privileges.  This is
independent of who owns the radio.

That's the hardest thing that I have to teach to ops using our club
facilities and fixed facilities at ARES/RACES served agencies which
hold individual call signs.

Don't make me look it up and print it -- I'll bill you for the
research! <ggg>

Welcome to rec.radio.amateur.moderated! This is a moderated newsgroup for amateur radio operators and other people having an interest in the Amateur Radio Service, as defined by national regulations and international treaties. Following are the posting guidelines for this newsgroup.

This message includes the following sections:

1. Topics and posting policies from the rec.radio.amateur.moderated Charter
2. Additional posting guidelines
    2.1 Netiquette guidelines
    2.2 Posting form requirements
    2.3 Guidelines on signature (.sig) files
    2.4 Guidelines on excessive quoting

2.5 Guidelines on pointers to outside sources
2.6 Guidelines regarding questioning someone's suitability to hold an amateur radio license
2.7 Guidelines regarding name-calling
2.8 Guidelines regarding civility
2.9 Other unacceptable topics

---

1. Topics and posting policies from the rec.radio.amateur.moderated Charter

rec.radio.amateur.moderated is an inclusive on-line community of amateur radio operators and other people having an interest in the Amateur Radio Service. Participants are invited to engage in open discussion of amateur radio issues and exchange information about participating in the hobby/service, in an atmosphere of civility, friendship, and fun.

Acceptable topics include but, are not necessarily limited to, questions and discussions about amateur radio licensing, regulations, tips on various aspects of setting up an amateur radio station, and sharing operating experiences and insights.

Unacceptable posts include, but are not limited to, buy/sell/trade posts, posts that are off-topic to the Amateur Radio Service, posts promoting or defending unlawful activities, etc. Crossposts of regular discussion articles between rec.radio.amateur.moderated and other discussion newsgroups are not permitted.

Frequently-Asked-Questions lists and other information/bulletin/announcement postings may be crossposted to rec.radio.info, rec.answers, and news.answers only with prior approval of the moderators of those newsgroups. In all such cases, an appropriate "Followup-To" header, containing only rec.radio.amateur.moderated, will be added by the moderators if one is not already provided.

Posters are encouraged to state their own views and share their experiences, but to refrain from making assumptions about the motivations of other newsgroup participants. Posters are expected to maintain a basic tone of civility. Prohibited uncivil discourse includes, but is not limited to, name calling.

Posts containing unsolicited advice questioning the right, worthiness, suitability and/or readiness of any individual (or members of any group) to be an amateur radio operator are unacceptable in this newsgroup. If an individual chooses to post asking for advice on when or whether to obtain an amateur radio license, or to participate in any type of lawful activity in the Amateur Radio Service, respondents should be careful to address their comments only to the original poster and not explicitly generalize to others in similar situations.

Similarly, posts that arbitrarily declare certain classes of amateur radio licenses, or certain members of national amateur radio societies (e.g., American Radio Relay League, Radio Amateurs of Canada, Radio

Society of Great Britain, Wireless Institute of Australia, etc.), to be more or less worthy than others, are not permitted. Posts that politely encourage individuals to join their local amateur radio society, or to upgrade to higher classes of amateur radio license in order to enjoy greater operating privileges, are permitted, however. Posts that contain reasoned, civil, and fact-based discussion of the activities and internal politics of national amateur radio societies are also permitted.

Buy/Sell/Trade and Commercial Policy:

Posts containing offers to buy, sell, or trade are not permitted on rec.radio.amateur.moderated. The rec.radio.swap newsgroup was created for this purpose, and should be used instead. All such articles will be rejected by the moderators with the advice to re-post to that newsgroup.

Postings that are entirely commercial press releases, advertisements, or other public relations campaigns will not be permitted. Relatively unbiased announcements or reviews of new amateur radio-related products or services may be permitted at the discretion of the moderators. Such posters are asked to disclose their financial or professional interest, if any, in such products or services.

----

2. Additional Posting Guidelines

2.1 Netiquette guidelines

Participants who are new to Usenet should familiarize themselves with the "netiquette" of Usenet as well as the particular posting guidelines for this group. Several useful posts for "newbies" can be found on the newsgroup news.announce.newusers or on the WWW at:

http://www.faqs.org/faqs/by-newsgroup/news/news.announce.newusers.html

Particularly helpful articles are:

- Welcome to Usenet!
- Rules for posting to Usenet
- Hints on writing style for Usenet
- A Primer on How to Work With the Usenet Community
- Emily Postnews Answers Your Questions on Netiquette
- Answers to Frequently Asked Questions about Usenet

2.2 Posting form requirements

Any article that falls into any of the following categories will be automatically rejected:

A) Articles that contain original text of more than 75 characters per line
B) Crossposted articles to newsgroups not included in these

Guidelines
   C) Articles that contain more than 400 lines
   D) Encoded binary files (except PGP and other short digital signatures)
   E) Attachments to posts
   F) Articles containing obscene language
   G) Articles from individuals who have been suspended or banned from the newsgroup

2.3 Guidelines on signature (.sig) files

Many people close each article they write with a few lines of common text. This may be a cute quip or quote, or may include information about their family, contact information, or disclaimers required by their employer, for example.

Signature files used on rec.radio.amateur.moderated posting must be no longer than 8 lines.

The content of a poster's signature need not be relevant to amateur radio, but it must not violate any of the other posting guidelines. (For example, name-calling that would not be acceptable in the body of a message is also unacceptable in a signature.) Posters may include Uniform Resource Locators (URL's) and business addresses in signature files, provided they comply with all the other guidelines regarding signatures.

2.4 Guidelines on excessive quoting

Posts more than 20 lines long that also have more than 75% quoted text will be carefully reviewed by a moderator to determine if that degree of quoting is warranted. Posts with excessive quoted text may be rejected.

Posters must show a reasonable effort to trim the post they are replying to and to include just enough material to establish context. "Me too!" posts are discouraged, and, when posted, must edit the quoted material significantly.

2.5 Guidelines on pointers to outside sources

Unsolicited announcements and pointers to web sites that are strictly commercial press releases, advertisements, or other public relations campaigns, are not permitted. However, a pointer to a website or other external source of information is permitted and encouraged in cases where it is relevant to an existing thread, with appropriate context being given in the post. A URL with no information about what a user should expect to find there will be rejected. A pointer to information that is off-charter for rec.radio.amateur.moderated will be rejected, as will a pointer which itself does not meet the rec.radio.amateur.moderated guidelines (such as a URL containing embedded name-calling).

Moderators are not responsible for verifying the contents of any

external information source.

2.6 Guidelines regarding questioning someone's suitability hold an amateur radio license

Identifiable groups and individuals may not be asked/told/etc. not to obtain an amateur radio license, or to only obtain certain classes of amateur radio license. It is not permissible to make statements that a person or members of a specific group "should" not, or should not be allowed to, become an amateur radio operator.

Solicited advice of this type is permissible; however, posters must be careful not to explicitly generalize to others who are in some way "like" the poster asking the question. Stick to the individual asking for advice.

It is acceptable to discuss verified violations, documented in criminal convictions or other government enforcement actions, by a person or members of a specific group.

2.7 Guidelines regarding name-calling

Nastiness addressed at a person is considered name-calling. Criticizing a person's *actions* is not, provided that it is done in a civil manner.

Attacks on an action which by their very nature include an accusation against the person's character are not acceptable. For example, "That's a lie" implies an intentional prevarication, and is considered name-calling. Acceptable ways of questioning the truth of a poster's statement include the more tactful "I don't think that's true," "I believe you are mistaken because..." or even simply "That's not true." "That's not true and you know it" crosses back over into name-calling, however.

2.8 Guidelines regarding civility

By charter, posters are expected to maintain a civil tone in all their postings. The guidelines on name-calling cover part of that requirement, but not all of it.

In general, posters are expected to consider the reputations of other participants, and refrain from making unnecessary accusations or assumptions about the motivations of others. A good rule of thumb is to phrase your comments as your opinion -- "I think..." "It seems to me that..." "This makes me wonder whether..." etc...

Posters are expected to make factual claims, to debate topics openly and in good faith, and to accept honest criticism, all without provocation or prevarication. At least one professional organization, the Institute of Electrical and Electronics Engineers (IEEE), has recognized that such fair dealings are necessary components of ethical conduct, and has incorporated them into its Code of Ethics:

http://www.ieee.org/portal/pages/about/whatis/code.html

Though the Amateur Radio Service is not a professional endeavor, the moderators strongly feel that the IEEE Code of Ethics is also a worthwhile set of guiding principles for participants in the rec.radio.amateur.moderated newsgroup.

Posters are not required to support the American Radio Relay League (ARRL). However, they are expected to adhere to the spirit of the other parts of the ARRL's "Amateur's Code":

http://www.arrl.org/acode.html

2.9 Other unacceptable topics

Participants are reminded that the charter also prohibits posts promoting or defending unlawful operating practices.

Posts may discuss whether operating practices are unlawful, or engage in reasoned debate over why certain operating practices should or should not be unlawful. Posts may discuss enforcement actions, such as by the Federal Communications Commission in the United States or similar government agencies in other countries, and evidence gathered by parties such as Official Observers in support of complaints about unlawful operation.

Discussions of what practices constitute unlawful operation in the Amateur Radio Service should be limited to *factual* descriptions of the laws in various jurisdictions. Posters' *opinions* as to what practices they consider unlawful are not permitted. In particular, posters are cautioned not to extrapolate their country's laws and regulations to those in other parts of the world, as they may be quite different.

Posts that entirely concern themselves with other radio services or hobbies, such as Citizen's Band, General Mobile Radio Service/Family Radio Service, and Scanner or Shortwave Listening, are considered off-topic to the rec.radio.amateur.moderated newsgroup. Newsgroups such as rec.radio.cb, rec.radio.scanner, and/or rec.radio.shortwave may be more appropriate venues for such posts.

Posts that attempt to publicly criticize moderators or moderation decisions in the newsgroup itself are also not permitted, as stated in our original newsgroup charter. Please direct any such critical feedback to our administrative contact address at the bottom of this article, where it will be carefully considered by an appeals team of moderators. This team is distinct from the initial team of moderators that approves or disapproves article submissions, and thus can provide independent oversight of moderation decisions.

Similarly, if you see an obviously inappropriate article in our newsgroup, please assume that it was a mistake or a direct forgery. The moderation team makes every effort to protect the newsgroup from such incidents, but they do happen, albeit rarely. You may also submit

```
feedback to the same address regarding such articles in our newsgroup,        |
but it is likely that our monitoring software and procedures have             |
already detected it, and we are actively handling the problem.  Please        |
resist "piling on" with followups to the newsgroup when these incidents       |
occur, so that we don't have to reject such articles.                         |
```

Please direct any comments, questions, or criticisms about this article to rec-radio-amateur-moderated-request@panix.com.

(Adapted, with permission, from the misc.kids.moderated Posting Guidelines.)

The real story is that it was the Central Electronics (CV ??) exciter that had that scheme.

USB was the commercial standard for the 50 years or so that I've been
in that business. Even with ISB (Independent SideBand) where each
sideband has different information, the "lower" sideband(s) are not
inverted relative to the "upper" sideband(s).

Don't tell the GPS folks that they need a backup! They are firmly convinced that their system is the greatest thing since sliced bread! <ggg>

Yes, the CE 10A, 10B and 20A exciters all used a 9 MHz SSB
generator. They were quite popular in the 1950s.

But they could not be the source of the amateur LSB/USB convention,
because that scheme does not invert the sideband on
either 75 or 20.

Several years ago I had a QSO with a crusty old Navy type who had just retired, somewhat in disgust because the service was no longer teaching things like Morse code and how to use a sextant to do navigation. His contention was that if there was another war the enemy would knock out the US navigation satellites, we would knock out their system, and for the rest of the war both nations' fleets would wander the seas, lost.

I wonder how big the solar event would have to be to render GPS unusable. If that or something else took away the capability, it would certainly have a huge impact these days.

You thinking of LORAN C which is 100Khz, not LORAN A which was
1800Khz to 2000Khz and was Phased Out in the 80's

That's why the Japanese are teaching there machinists the old way's
along with the new. They call those old teachers "super machinists".

It's not been an issue for me until this Christmas when my wife
decided to get me a VHF/UHF mobile rig. I've been using an older Icom

2 meter rig in both the cars for years so both cars have Icom power cables in place, but the new rig doesn't use the same power connectors.

I'd like to settle on a common power connector for both the radios, but I'm not all that sure where to go to find something that is reasonably priced and is not going to disappear in the future and force me to go out and buy all new connectors again.

I figured I'd not remove any of the existing connectors on the radios, but build up short jumpers that adapt to the connector of choice. I also figured that I'd use the existing power wires by replacing the current Icom power connector with what ever I pick.

Any suggestions on what to use and where to get them?

Many groups seem to have standardized on power connectors for interchangability reasons during events (including real disasters, etc.) For example, in my area the PowerPole connectors from Amp are the standard.

I buy my supplies from my specialty dealer (who is a ham)...
http://www.dcpwr.com/ But the connectors and accessories are available from many places.

What I did years ago was build a Conversion Cable using the Propritay Power Plug of each rig and a common AMphenol Power Connector, with say 3 inches of wire in between. The Amp Connectors can be had from DigiKey, Mouser, even Jameco, or your local Electronic Components Supply House, and you just buy a dozen extra for stock, and your set for life.....

I use "bullet" connectors, common in the UK for making up power leads, not sure if you have them in the US..?

Here's a link to a UK supplier, you can see there what they are, obviously
you would use them in a polarised fashion, with the female connector on
the "live" feed from the battery.

These are the female ones:
http://www.maplin.co.uk/module.aspx?ModuleNo=42724&doy=18m12

Male:

http://www.maplin.co.uk/Module.aspx?ModuleNo=42722&&source=14&doy=18m12

Hope this helps, note to whoever moderates this, I know it's a commercial
site but it's intended purely as a means of showing the type of connector
I mean :-)

Icom VHF radios now all use the same T connector, and I believe almost all other major manufacturers have moved to that connector for VHF/UHF radios. Different connector for HF, tho. As KE7GKP points out, a *LOT* of groups are moving to Anderson Power Pole connectors as a common connector, and this is pretty convenient around the shack, too. Simply make a pigtail for each rig with an APP connector, and now anything can connect anywhere, and odds are your local club or ARES group will have a similar convention.

One of the issues has been that lower cost/smaller connectors could not handle the current required for HF radios. While they APPs are available for different current levels, they can interconnect. So you can put a 45 amp connector on your power supply and plug in a radio with a 15 amp connector.

Well, after some investigation online, it seems that the Power Pole solution is likely the most flexible for my purposes. The ARES group I'm in doesn't specifically specify a configuration, but many of the other groups in the area do specify the Power Pole.

I also decided to continue this standard into my shack so I can move the various radios between various locations and not have to worry about coming up with power connections all the time. There are also some very nice distribution panels available from various manufacturers that use this standard. I also found a distributer that also has some clips that hold the connectors together in high vibration environments (like my cars) and they also had some dust covers to hopefully keep the dust and kids' fingers out when no radio is installed.

I do wish that Anderson would put out a 2 conductor version of their "power pack" products. It would be nice if you could build these with built in clips and only have the size of 2 conductors instead of their minimum 4, but I guess there may not be a huge market for that. Well if they do come out with them in the future, it should be easy to retrofit if I want.

Thanks for the help..

If you decide to go with the Anderson Power Pole connectors, Powerwerx has a good selection. I would also consider buying the West Mountain Radio crimper as I have found it makes an excellent crimp that slips easily into the plastic shell. I tried the cheaper G&B crimper and had trouble making a consistent crimp that snapped into the shell easily.

APPs have an approximately 5 lbs seperation force rating, so you'll want to avoid much tension on the connector in your installation. I have them in my mobile installations without issue.

Not to intentionally hijack the thread, but... ;-) Where can I buy those T-connectors? I've looked in Allied and Newark catalogs and can't find them. In order to make jumpers or quick-disconnects, for example, I need to have a T-connector for my Yaesu mobiles (FT-1500 and FT-7800R) to attach to the radio's existing cable. I'm not going to cut off the existing cable.

One source is http://www.powerwerx.com

They'll sell you the OEM "T" connectors with inserts ($1.95 per), or
a pre-made OEM-T-to-PowerPole adapter cable ($10 for a one-footer), or
a "universal both sides adapter" (one male T, one female T, two sets
of PowerPoles) for $15.

They also have the IC-7000 power connectors, FT-100 connectors, 6-pin
Molex, and lots of other goodies.

Oh... I've been advised that it's probably better not to use the small
metal "roll pins" to lock together individual PowerPole housing pairs.
At least one person has had problem with these pins popping out of the
connectors and (potentially) bouncing around in the vicinity of
battery terminals or other "hot" electrical contacts. Not good. If
you want to lock together the red and black halves of a pair, I'm told
that a drop of acetone or cyanoacrylate glue is a better way to do it.

I don't know if this caution applies to the retention clips, as I
haven't tried using these myself and don't know anyone who has.

A quick note re: Power Poles and mobile operation.

Use the smallest cable tie to hold the two connectors together as they
sometimes have a tendency to shake / pull apart.

They have little clips you can get to prevent them pulling apart.

I pretty much always get them at hamfests, but I often end up getting them from Tower Electronics, who has an online presence.

http://www.pl-259.com/page4.html

Looks like they are more expensive than PowerX tho. About the same for the plug but double for the socket.

Kenwood also.

Does anyone know where I can get a supply of these "T" connectors, both the male & female ends?

I have found the female connectors with 6' of heavy wire and fuse holders for about USD20, which I see as a bit pricey, but not the male ends (the end that is on the radio).

http://www.powerwerx.com

Click "Connectors" on the left, then "OEM Connectors".

The OEM "T" male and female connectors are $1.95 per connector (one
shell and two inserts).

I've bought them from Tower Electronics, http://www.pl-259.com/ .  I'm
sure there are a number of other vendors online.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group every month. You are now reading the first article, which explains what rec.radio.info is, and answers some Frequently Asked Questions. The second article is titled Posting Guidelines, and you only need to read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
next
" -- " string. The sections available are:

 - What is the purpose of rec.radio.info?
 - Why are messages almost always cross posted to rec.radio.info?
 - What is a 'follow-up', and what does 'moderated' mean?
 - OK, so now I know what 'moderated' means. Tell me more.
 - What type of material is considered inappropriate?
 - I do not have access to news, how can I get the information posted to

rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit chat about radio. Rec.radio.info will contain informational, factual articles only. Follow-ups are redirected to an appropriate other group, and further discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propagated across the net). This tag also facilitates a pre-existing method of dropping or canceling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

```
/Newsgroups:.*[ ,]rec\.radio\.info/h:j
```

either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

```
rec.radio.info:!s/:^
```

in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

```
sequence
rec.radio.info
rec.radio.
```

at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

More information about kill files may be obtained from Dave Fawthrop's Killfile FAQ at:

http://www.hyphenologist.co.uk/killfile/

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, we will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for discussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is the rec.radio.amateur.moderated

Moderation Team. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@panix.com

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

rec-radio-info-request@panix.com

But before you do so, please be sure to check out the "Posting Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. We receive information in our mailbox; we then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

   rec.radio.swap may be more deserving of the posting in any matter.

   Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, We would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. We reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all we can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

Google has an excellent web interface to Usenet newsgroups. It is available at:

http://groups.google.com

It supports both reading and posting.

Another excellent web interface to at least the radio-related Usenet |
newsgroups is the RadioBanter site: |

http://www.radiobanter.com |

sponsored by the NewsgroupBanter project: |

http://www.newsgroupbanter.com |

It, too, supports both reading and posting. |

-- Will the material appearing in rec.radio.info be archived somewhere? |

Yes. See Google Groups and RadioBanter above. |

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires co-operation and goodwill to be beneficial to the community in the rec.radio hierarchy.

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

*** rec.radio.info - Posting Guidelines and Etiquette ***

Two introductory articles about rec.radio.info are posted to this group and to rec.answers/news.answers every month. You are now reading the second article, which explains how to submit something to rec.radio.info, and which answers some Frequently Asked Questions about the submission process. The first article is titled "Welcome to rec.radio.info", and it might be a good idea to check it out as well.

-- How do I submit something to rec.radio.info?

Two possibilities. You can use your newsreading software to just post the article to rec.radio.info, as you would do with any other newsgroup. The difference is that the software recognizes the special status of rec.radio.info as a moderated group, and will e-mail your article to us, the moderation team, instead of posting it to the group.

Alternatively, you can mail your article directly to us at the following address:

rec-radio-info@panix.com

Mailing us directly is probably (a wee bit) faster, but using the transparency offered by the newsreading software is probably more convenient.

If you have any questions, or wish to deal with some administrivia with the moderation team, we suggest mailing to the following address:

rec-radio-info-request@panix.com

-- How soon will I see my article appear?

It depends on how busy we are. Your article reaches us as mail, we have to read it first, give it the stamp of approval, and finally send it on to the group. We will attempt to read and decide on all submissions within 72 hours at the very least, though we will probably be able to process submissions much faster in actual practice.

The site from which we moderate this newsgroup, "Public Access Internet and Unix, NYC" (Panix), is directly connected to the Internet, and articles posted at that site should appear at most major news sites, including Google Groups, the same day. The principal delay, therefore, will be the wait in the moderator's submission queue.

If you post a periodic article, and have shown to be trustworthy, we may allow you to post directly if the article is of a timely nature. See the section below on direct posting.

-- Should my article be in a specific format?

No. If it is not totally illegible, we will accept it, and if it does not have a correct subject-line we will correct it with your permission
-- that's what a moderator is for.

However.

You could do us a big favor by making sure your article conforms to these simple requirements:

1) The article must present information, not discussion or requests, We will reject the article or require you to change the wording if it is worth it.
2) A good, descriptive Subject line.
3) Always mention what source you got the information from.
4) Don't forget to include a Followup-To header, at least if you don't want further discussion to automatically be forwarded to you, the poster, which is the default if the article is only posted to rec.radio.info.

As we said: if your article is appropriate we will post it even if you don't follow these guidelines, but then don't blame us for not processing it immediately. 'Perfect' articles we can send on with a couple of keystrokes. Stuff that needs minor editing is going to have to wait until we have time to do so.

Please do not waste both our and your time by posting requests, as this is an information only news group.

-- What about crossposting?

If you send something to rec.radio.info, just name any group you'd like to cross-post to in the Newsgroups field. Then, when we approve the article for rec.radio.info it will get automatically cross-posted to any other groups mentioned. This will also override the default Followup-To: poster, replacing it with the groups you cross posted to.

We would prefer if the group be cross-posted to the various discussion groups in the rec.radio.* hierarchy that are appropriate:

rec.radio.amateur.misc	Amateur (ham) radio and related matters
rec.radio.amateur.packet	Amateur Packet Radio discussions
rec.radio.amateur.policy	Amateur Radio practices, rules, etc.
rec.radio.noncomm	Non commercial radio discussions
rec.radio.shortwave	International broadcasting on the 'HF' bands
rec.radio.cb	Citizens Band (27 MHz) discussion
rec.radio.scanner	Scanner discussions (unsupported group)

or in one of the moderated groups:

rec.radio.amateur.moderated	Amateur radio practices, rules, etc.
rec.radio.broadcasting	Discussion of *domestic* radio broadcasting

We will leave it up to the poster to decide which group(s) are appropriate, but reserve the right to add groups if we feel it has broader interest. We will consult with the poster first.

Notes on crossposting:

- rec.radio.broadcasting is also a moderated group. The rec.radio.broadcasting moderator prefers to review all articles himself before posting. Placing rec.radio.broadcasting before rec.radio.info on the Newsgroups line should accomplish this. We will typically abide by the rec.radio.broadcasting moderator's decision whether the article is appropriate for rec.radio.info.

- rec.radio.amateur.moderated is also a moderated group. As the rec.radio.amateur.moderated Moderation Team manages both rec.radio.amateur.moderated and rec.radio.info, we can manage crossposting and approvals for both newsgroups. The rec.radio.amateur.moderated group does not allow crossposting to other discussion newsgroups, whether moderated or unmoderated. However, we would like to manage rec.radio.info as consistently as possible with how it was done by previous moderators, including the grandfathering of existing regular postings. Therefore, the submitter can choose rec.radio.amateur.moderated or the other unmoderated rec.radio.amateur.* discussion newsgroups for crossposting, but not both.

- Any FAQ or informational posting approved by the rec.answers/news.answers moderation team that is also crossposted to any rec.radio.* newsgroup (besides just rec.radio.info) is also automatically pre-approved for rec.radio.info. See below for more information.

If you post to another moderated group, it may be better to make special arrangements with both moderators before posting by contacting us at our administrivia addresses.

In addition, cross-posts do not take up extra space; modern newsreaders can be configured to show you cross-posted articles only once anyway; not everybody reads rec.radio.info; and rec.radio.info was never meant to reduce the volume of the regular discussion newsgroups. But keep in mind that some of the mail gateways may filter out the informational postings (at request of the subscribers) to keep the load down.

You decide.

-- I have a regular posting with timely information, can I make arrangements to help speed up delivery by posting directly from my site?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires cooperation and good will to be beneficial to the community in the rec.radio.* hierarchy.

If you are currently maintaining (or plan to maintain) a radio-related periodic information posting, you may wish to consider crossposting it to rec.answers/news.answers. Postings that are approved by the rec.answers/news.answers moderators for this treatment are automatically pre-approved for crossposting to rec.radio.info (as the news.answers requirements are far more rigorous than the requirements this newsgroup ever plans to use). For more information about this option, consult the appropriate information articles and posting guidelines in rec.answers/news.answers.

Realize also, that even if your post is not approved for rec.answers/news.answers, it can still be approved for rec.radio.info. The intention is not so much to get every last bit of radio-related information on rec.answers/news.answers, but rather to provide an alternative avenue of approval (as well as grandfather existing maintainers of radio-related information and spare them additional bureaucratic hurdles). Again, crossposting to either rec.radio.info or rec.answers/news.answers, both, or neither, is at the discretion of the poster (subject to the approval of the moderators). You decide what is most appropriate for your article.

Please remember that as an information maintainer, you are not alone. There are many others on the net who maintain and post periodic information postings, using various intermediate-to-advanced features of Usenet (usually via automated tools). Various degrees of technical support and general hand-holding are available from many Usenet veterans. Send us some E-mail describing your needs to our administrative address below, and we'll try to help, or at least refer you to the right knowledgeable individual(s).

-- And Follow-ups?

If the only newsgroup you have specified is rec.radio.info, then the Followup-To: field will always be set to poster. If you do not want this, you must supply a Followup-To line of your own, and we will honor that one, as long as it is a subset of the original Newsgroups line.

If you specify newsgroups to cross-post to, then the Followup-To field will be set to include all the cross-posted groups, excepting rec.radio.info itself. Again, if you do not wish this behavior, supply your own Followup-To line.

We maintain other standards on the various RFC-1036 (news transport) header lines. For example, if the article is appropriate for passing into the Packet Radio Information Network, we encapsulate the Packet Bulletin Identifier (BID) in the Message-ID: news header line indicating the machine of origin as the ampr.org domain:

```
 Message-ID: <$opa.55.1994@ampr.org>                                      |
```

where the Packet Radio BID, in this example, is `$OPA.55', and it was posted in the year 1994, because some of the Bid numbers are cycled yearly. Hopefully, this can be used as a key to re-introduce the articles for the Packet Radio network. Also, if the article is a repost of an already existing information article in the rec.radio heirarchy, we ensure that the References: header line is linked to that previously posted article. This also helps to tag articles, and may be used for additional filtering if needed.

Since the articles are archived, please use the Summary and Keywords header lines to help one search for your article.

-- Why have I received no reply from you?

We never reject anything in silence, and we make a point of it to answer all our mail. However, E-mail, like a brain cell, can and does get lost, every now and again.

So, if you send us something, and you don't see it appear it rec.radio.info, and you still have not heard from us in reply after say, five days, you can be pretty sure that either your mail never reached us, or that our answer has never reached you. In that case, please try again (We will filter out duplicates).

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

(Adapted, with permission, from the original article written by Mark Salyzyn, AG4YD, ex-VE6MGS.)

I suggest Powerpole connectors, since they are becoming quite popular among hams active with RACES and ARES. One source is http://www.powerwerx.com/ (the 15/30/45 ampere model; the shells are all the same and the metal insert is chosen based on wire size).

Note that the crimp connector from Anderson is expensive. Powerwerx suggests a GB crip tool, which I have. It tends to make the metal pieces a bit too wide, so you have to squeeze them with pliers to make them fit into the shell. You might want to solder them, if you're good at that.

You might want to use the correct tool - the West Mountain ratchet crimper. I invested in one of those several years ago and consider it one of my best tool investments in all the years.

Do you know whether the die (anvil-and-punch) sets for the PowerPole
connectors are available separately? There are several brands of

ratchet crimper handles which take interchangeable die sets (Ideal and Paladin among others). I've got one such, and I'd rather spend $25 or so on a die set to add to my collection rather than buying a whole new set of handles.

Hi Phil,

I know what you are saying, but there is a world of difference between the seemingly clear rule and the reality. Our club has 3 call signs. Which do I use? I've loaned equipment to the club to use for field day. Must we operate under my call sign, and don't forget the other equipment is the club's, or might be other equipment loans.

Some times there could be so much discussion about what the "proper" call

sign is to use that people might just pack up and go home.

Are you sure that all three have the same club name? The station
trustee is responsible for telling the operator(s) what the correct
club call sign is.

Our club has a club call sign covering all of our activities, and
there is a sub-group of contesters in the club who have obtained a
different club call sign - with a different licensee - for contests
that they participate in separate from the club station.

>I've loaned equipment to the club to use for field day.
>Must we operate under my call sign, and don't forget the other equipment
>is the club's, or might be other equipment loans.

No. Unless you "declare" that it is your personal station. The call
sign to be used is not tied to the ownership of the hardware.

You don't want to be stuck with the violations of someone else.

```

Finally got the Yaesu FT-60 I've been pining for from the SO for xmas; was wondering whether anyone's familiar with any Mac or Linux programming software for it. I have the serial cable and a USB/serial adapter, but a day's worth of Googling hasn't turned up any software for anything other than Windows.

Is there any programming software for Mac/Linux, or am I stuck either finding a Windows machine or running a Windows instance in VMWare to

program it? (Setting aside the ability to program it by hand, which
looks like no fun at all, particularly given that I have a cable...)

Any and all suggestions are welcome.

73 and happy holidays,
KB1JMV

The dies are removable on the West Mountain crimper (I just checked), but

it is a different style handle than the RF Industries Handle I have at work. I didn't try to see if they would interchange and I don't know if WMR would sell the dies seperately. I recall paying about $50 for the WMR crimper from Powerwerx.

The WMR crimper gives a perfect crimp so long as the handles aren't squeezed beyond the point where the ratchet releases.

And there is an important part of the equation. Is there an F.C.C. form in which the "station" is declared as belonging to which call sign? If I borrow a friend's HT to call back somone who calls me, I think I am technically in violation of what station is what and who's station.

> You don't want to be stuck with the violations of someone else.

Indeed. I think that this is one of those gray areas in which we some times find our selves.

It reminds me of a drawn out discussion once about "Is it illegal to use an antenna analyzer?"

After a whole lot of cogitation, the consensus was that it was indeed illegal to use one without ID'ing, but that the F.C.C. enforcement officer would be sorely tempted to box your ears if you turned someone in for using an antenna analyzer.... 8^)

The Hamlib project, http://www.hamlib.org welcomes contributions for all manner of rigs. However, if the control information cannot be freely obtained, such as requiring a Non Disclosure Agreement, then we cannot utilize it. If the FT-60 has CAT control information in the manual, then

it shouldn't be difficult to add support. Otherwise, as I suspect, someone will need to reverse engineer the protocol.

I'd say virtualization is the best bet as Yaesu would not likely open source their code or port it to multiple platforms. Parallels or VMware would be my choice.

It would be interesting to know what high level language Yaesu used to create the Windows port. My guess would be C# or something using Visual Studio that locks it strictly into Windows. If it was C++ or Java a straight re-compile is all that would be necessary.

You might look into vxur/vxuw at http://www.onjapan.net/ham to see if it might work for you. I just built it from the source code. I have both an FT-857 and a VX-5R. Since Yaesu used, apparently, the same protocol for programming both, my suspicion is they kept that for the FT-60, although don't know.

The documentation says to put the rig in 'clone' mode and then you use the program command line interface to download or write memory. I may do some experimenting with my VX-5R if I can located pin-outs on the radio, probably from my mic/phone jack, for the rs232. Might be fun to try. (My email address at top is good for off-line if you wish.)

No violation. That situation can be viewed either of two ways,
both equally valid and both equally legal - you are borrowing hardware
for YOUR station and use your call sign, or you are operating HIS
station and use his call sign.

>> You don't want to be stuck with the violations of someone else.

Depends on the power level used by the Analyzer. It may be operated
as a Part 15 device - no license, no ID - if it meets those
requirements.

It did take some enthusiastic people. One person is not enough, although one person can start the hunt for a few more.

See the AC6V Web Site for places to phone or e-mail or check websites for

fleamarkets in SOCAL
http://ac6v.com/sdswap.htm#sdswap

Don't know how current the info is but there are some contact points you can make.
Relative merits are in the eye of the beholder (:-)
Have heard some comments about lots of computer stuff.

Lamont

>Many yeards ago I read an article which stated that back in World War One days President Wilson convened an advisory council composed of a number of prominent Americans from different fields. Edison was a member. Somebody suggested that Einstein would make a good addition to the group. Edison's comment was something like "Somebody like Einstein might be handy to have around in case somethimg needs to be figured out."

>w3rv

Sounds like an interesting story. No disrespect intended if I say that it sounds apocryphal, though many credulous-sounding stories do sometimes actually turn out to be true (see http://www.snopes.com for the straight skinny on many of them). Perhaps the basic back-story is true, but with one or more different players (see below).

This one caught my eye, as someone who has a passing interest in American history from formal education in school, later personal reading of biographies by David McCullough, Steven Ambrose, etc., and from additional training that many Americans get: specifically, from watching hundreds of episodes of the game show "Jeopardy" :-).

I was wondering if someone else with more expertise in the subject had some additional insight. Googling around doesn't seem to demonstrate that the story is true, nor does it demonstrate that the story is untrue. One thing that makes me suspicious is that for these three men (Wilson, Edison, Einstein) to have knowledge of one another in the way that the story suggests, their timelines, particularly the periods during which they were famous in the United States, would have had to significantly overlap.

President Woodrow Wilson lived from 1856 to 1924 and served as President from 1913 to 1917.

Thomas Edison lived from 1847 to 1931, and generally became famous as an inventor after the invention of the phonograph in 1877.

Albert Einstein lived from 1879 to 1955, became well-known among physicists sometime during his famous, and initially controversial, research published from 1905 to 1915, won the Nobel Prize in 1921, visited the U.S. shortly afterwards, and eventually became well-known among most Americans (including Presidents) sometime after he emigrated to the U.S. in 1932, certainly sometime during or after World War II.

Some points to ponder:

- An early 20th Century U.S. President like Wilson might have been aware of American winners of the Nobel prize, but might he have been made aware of a still relatively obscure German/Swiss physicist before he left office in 1917, pre-Nobel?

- Even if we assume that the President was Warren Harding (who was close to Thomas Edison, even camping out with him in Maryland during his presidency:

  http://www.ohiochannel.org/your_state/collections/collection/details.cfm?collection_id=78985&file_id=81864

  Harding only served briefly from 1921 to 1923. A better match would be Herbert Hoover, who clearly was aware of Albert Einstein:

  http://www.presidency.ucsb.edu/ws/index.php?pid=22068

  and served during the time that Thomas Edison was still alive:

  http://teachpol.tcnj.edu/amer_pol_hist/thumbnail341.html

- Hoover's successor, Franklin Delano Roosevelt (FDR), only became president in 1933, two years after Edison died in 1931.

- Thomas Edison was a great inventor, but an individual without much formal education. Would he have necessarily been aware of what was going on in a theoretical academic field like Physics before 1917, and before Einstein had even done recognized works in that field? Recall that the General Theory of Relativity, published in 1915, was not widely accepted until years later, his Nobel Prize was for the Photoelectric Effect, and as a resident of one of the countries in the Central Powers (opposing the U.S., France, and the UK during WWI), his work would be censored from international publication during most of Wilson's term, anyway:

  http://en.wikipedia.org/wiki/Albert_einstein#Light_and_general_relativity

- The only reference I could find to Albert Einstein and Thomas Edison even just in communication with one another was this photograph from 1930:

  http://www.topfoto.co.uk/gallery/einstein/default.htm

where Einstein telephoned Edison (from Germany) to congratulate him
on the 50th anniversary of the invention of the electric light bulb,
much later than Wilson's term of office.

So, the timelines of Wilson, Edison, and Einstein don't really match up simultaneously. Nor do those of FDR match up with Edison, nor Wilson with Einstein. Either the President would have to be someone like Hoover or Harding, or the scientist would have to be someone else. At the very least, Einstein couldn't really be considered a "prominent American" until after he emigrated to the U.S. in 1932, and obtained U.S. citizenship in 1940.

Ob Amateur Radio: Thomas Edison was a contemporary of Hiram Percy Maxim (co-founder of the ARRL), who lived from 1869 to 1936, and is credited with inventing the Maxim Silencer for firearms, and the automobile muffler. Hiram's father, Hiram Stevens Maxim, invented the machine gun, and was involved on the losing end of several patent disputes with Edison over the incandescent light bulb.

So who broke the 10 meter band? More so who is going to fix it and
when? (Better be someone good as the last one who worked on it didn't
do so good.......downright well..... unsatisfactory!)

I suspect most scores from this weekend may look more like the typical
number of band changes on a multi-band contest than total score.

Beep beep,

de Hans, K0HB

The National Electrical Code (NEC) specifies that there be two grounding points for a residential system. That can mean either two ground rods, six feet apart, connected to the panel with a continuous loop of wire, or a single ground rod in cases where there is municipal water, and the second ground source is the water main coming in, on the road side of the meter. The gas line also needs to be grounded to the panel.

In the main service panel, the grounding system is attached to the same buss as the bare neutral coming in from the transformer. If your shack is running off a sub-panel, it should be fed with four conductor cable. In this case an insulated neutral is used and the bare (or insulated, it doesn't matter in this instance) ground is connected to a separate equipment ground buss. If your shack is in a separate structure that has its own sub panel, it needs to be fed with three conductor ground, the neutral is connected to the ground bar and a ground wire from a single ground rod is connected to the same buss (similar to the setup at the main panel). It sounds confusing as written here, and it's even more confusing to read it from the NEC, but I just had this out yesterday with my local inspector while going over the fine points on a job.

All that NEC stuff is important to check to make sure you're setup is electrically safe. As for station grounding, it's not usually a good idea to use the electrical system ground rods for your RF grounds. Your rig, tuner, amps, etc, should all be grounded to a single buss with the shortest possible wires, then a large chunk of wire, #6 or better, should run as directly as possible to a separate 8' ground rod. If you have a tower, you should drive at least one 8 footer at the base and ground it there. There's no limit to the number of ground rods you can have for RF grounds, they're less than $10 from a distributor and well worth the effort. I've heard of hams setting up verticals with very minimal radials, just driving several ground rods.

>>But somewhere along the line somebody in the ham groups stated that
>>the National Electrical Code states that there shall be one and *only
>>one* grounding point per power drop and the neighborhood code cops and
>>the insurance companies reportedly get stiff about it.

The answer to that is that if there is more than one they must be connected. The methods differ depending on the location of services in the structures and around the property. An electrician following the NEC would have done this during the installation and (hopefully) the inspector would have signed off on it. Ground rods for RF equipment SHOULD NOT be connected in any way to the electrical system ground rods.

My best DX for the 'test was Kansas and Nebraska.

My last was in error. I worked all the way out to NM and NV.

BNB Sound wrote:

> The National Electrical Code (NEC) specifies that there be two grounding points for a residential system. That can mean either two ground rods, six feet apart, connected to the panel with a continuous loop of wire, or a single ground rod in cases where there is municipal water, and the second ground source is the water main coming in, on the road side of the meter. The gas line also needs to be grounded to the panel.

Grounding the gas line here would be an exercise in futility. A metal pipe goes into the ground just outside my home. It is three feet long. It then connects to a plastic gas line which goes under U.S. Route 250 and runs to a gas meter about 100 yards away.

> All that NEC stuff is important to check to make sure you're setup is electrically safe. As for station grounding, it's not usually a good idea to use the electrical system ground rods for your RF grounds. Your rig, tuner, amps, etc, should all be grounded to a single buss with the shortest possible wires, then a large chunk of wire, #6 or better, should run as directly as possible to a separate 8' ground rod. If you have a tower, you should drive at least one 8 footer at the base and ground it there. There's no limit to the number of ground rods you can have for RF grounds, they're less than $10 from a distributor and well worth the effort.

That's a very, very bad idea. If your shack ground is not tied to your electrical ground and a near miss strikes power lines, the shack ground and your electrical ground will be at very different potentials. Your radio gear will be right in the middle.

> I've heard of hams setting up verticals with very minimal radials, just driving several ground rods.

I've heard of it too, but it is another very bad idea. There is simply no way that driven ground rods can substitute for a radial screen. They are intended to do different things.

>>> But somewhere along the line somebody in the ham groups stated that the National Electrical Code states that there shall be one and *only one* grounding point per power drop and the neighborhood code cops and the insurance companies reportedly get stiff about it.
>
> The answer to that is that if there is more than one they must be connected. The methods differ depending on the location of services in the structures and around the property. An electrician following the NEC would have done this during the installation and (hopefully) the inspector would have signed off on it. Ground rods for RF equipment SHOULD NOT be connected in any way to the electrical system ground

> rods.

That's simply incorrect and dangerous. I have connected my shack ground to my electrical ground with some great big honkin' copper wire. You may have as many different ground rods as you like. You should connect all of them to a single point.

I never considered a serious effort at this point the cycle. I did about three hours in the contest and quit when the Steelers-Patriots game began. I must have missed the DX. I worked SOAB HP mixed with:

71 QSOs 18 States on CW

47 QSOs 17 States on SSB

Total 13,370 mostly search and pounce

http://www.w9wi.com/ham/10m.gif

(I hope.)

It's an animated GIF, roughly 2.8MB. Shows which states I worked during
each hour of the contest - the little blue bar at the lower left is a
relative QSO count gradually increasing. (actually it's one pixel long
for each QSO made to that point)

Worked coast-to-coast including a nice little opening to VE7 and Seattle
around noon Sunday and one to New England around 0000UTC Sunday. (Sat.
night)

While true, it's also true that he served as President from 1917 to 1921.

:-)

Even in that sea of dates that I posted, I should have noticed that
Wilson was not a one-termer, and did serve through World War I Armistice
Day on November 11, 1918.

Correct. RF "grounding" is so different from Power ground that it shouldn't even be called the same thing. Good RF grounding can be had without a direct connection to the earth, my radials are insulated wire and don't have any wire exposure to the ground, so that they won't corrode. (note that the antenna gets direct connection to ground through the base.

It sounded freaky weird to me at first, but as I put in my radials over several sessions (criteria being how long my poor abused knees could stand it) I measured and adjusted the system each time, and it worked as advertised. More radials = better grounding. The coil at the bottom of my vertical required less and less inductance to match the system.

But it surely isn't a power ground, and given that the rf is absorbed (right word) at or near the ground surface, those ground rods would only be useful at that first foot or so.

Hi Jack,

It's what we call football (played with protective padding) in the states.
I would hazard a guess that soccer or rugby (played w/o padding) is a bit rougher.
I understand that the difference between soccer and rugby is that in soccer, injuring your opponent is incidental to scoring while in rugby, scoring is incidental to injuring your opponent. ;-)

73,
Bryan WA7PRC

American rules football.

(Pittsburgh vs. Boston. I think Dave is not too far from Pittsburgh.)

I think it's largely a chance thing - if the short-skip happens to go your way then it's best to be in the middle. (this year the Texans got the luck. Right now 5 of the 10 top claimed scores in high-power CW are in Texas.)

A bit like a cross between Rugby and Football for girls.
They wear padding and stop for a chat every few minutes.
In the USA universities are rated on the success of their teams rather than any academic achievement.

I Heard nothing but noise anywhere I tuned in the technician class segment
(28.5 and down). no signals, not even a local calling CQ. what gives?

I have just set up my vertical and a couple of HF rigs after a hiatus of
more than a decade. I have not heard a single station above 40M yet.
I did hear a PA0 on 80M, good signal too.

Guess I picked the wrong time to get interested again. :-(Looking
around for antenna wire now so I can get some kind of a dipole up as I
was really never impressed with the oerformance of any of my trap verticals.
Sure wish I knew what I did with that W3DZZ Trap Dipole I started with in
Germany 30 years ago!!

Not necessarily; there's nowhere to go but up as the sunspots return.

I run Faros on the PC in the shack every weekend, from Friday
afternoon 'til Sunday evening watching and waiting ...

http://www.dxatlas.com/Faros/

One of my earliest ham-radio memories is a 1961 CQ cover with the
depressing title "Cycle 19 - The Declining Years" (I was first
licensed in January 1961).

indeed except for some very local signals (and a bit on FD) I have not used the bands above 20m amuch at all and each station in my personal log between 20 and 6m has been one I help set oup the station and anttena myself

Well, I just went out this morning and put up a 40M dipole (best I could
come up with from the junk left over in my cellar) and it hears a lot
better than the vertical.  (A quick test using CHU showed it to be at
least twice as good as the vertical.  Heard some guys chatting on 20M.
Heard what sounded like some slowscan and some packet, too.  Nothing
above 20M but definitely better than what I heard during SS a couple
weekends ago.  Have to find a listing for beacons and start getting
into this again.  I had almost forgot how much fun it could be.  Maybe
my next house will even have a tower and an HF beam.  :-)

Wonder whent he next RTTY contest is?  That was always my favorite mode.

All the best for the holidays to everyone.

As another poster said, "Not necessarily". The higher bands do open, although less well than during a sunspot peak. Part of the problem, I think, is that so many people are convinced that the higher bands are dead that they don't bother to listen _or_ call CQ.

A few weeks ago I had a nice (brief but easily-copyable) PSK31 contact
on 20, from northern California to a polysyllabic city on the
Kamchatka peninsula. 35 watts and a simple horizontal dipole at 25'
on my end.

>   Looking
>around for antenna wire now so I can get some kind of a dipole up as I

Ordinary TTHN-insulated stranded wire from your local homebuilding
store works fine and isn't expensive. No need to get fancy, unless of
course you _want_ to get fancy :-)

The nice thing about a full 40m lambda/2 dipole is that it'll accept power on 15m as well. While 15 has been mostly dead, there have been times when there's activity. I don't have anything for 10m (yet) so I can't give my personal impression, though some hams have reported short openings. 40 & 80 have been pretty hot... worked China on 40 in the WWDX CW contest... heard a G3 working a pileup on 80m CW a few nights ago. I'm on the left coast and have just low dipoles for those bands (80m is a 4-wire cage inverted vee).

Yes, I've worked many VK... I should've mentioned Australian Rules Football.
A friend (with tongue in cheek) explained it to me, "The first rule is,
there are no rules." ;-)
As a kid, we used to play touch (American) football in the schoolyard. It
was too easy to tag a ball carrier, so we made it two-handed. That was too
easy, so we made it two-handed-below-the-knees. Whether your tagged the
ball carrier or not, you were headed for the ground. The question was how

much it was going to hurt! ;-)
73,
Bryan WA7PRC

No, they stop to allow TV commercials to be broadcast,

I have never seen an Elecraft product in use during those games.

A major point in my decision to go with a 40M dipole. :-)

It wasn't by any chance G3YEU, was it? A very good old friend of mine
from the days when I was DA1WO and he was DA1BS.

>   I'm on the left coast and
> have just low dipoles for those bands (80m is a 4-wire cage inverted vee).

Well, I do have a Dentron Super Tuner as well, so in a pinch I can work
any band (except 160 which seems to be not working on my Drake at the
moment.)

I was looking for a graphic of the US Ham Bands that included the ARRL band plan to replace the out of date posters in the club's shack. I went to looking around and found a few neat looking PDF files but I couldn't find a poster that has both the Part 97.301 and the ARRL band plan in graphical form.

I couldn't find what I wanted, so in true ham radio style I started to develop one of my own. While I was digging though part 97.301 and the ITU band plans I came up with an unanswered question. In Part 97.301, only 60 Meters is specified to be USB. The rest of the bands can legally be used with either USB or LSB when using SSB phone. I figured that the ARRL's band plan would specify USB or LSB for the band, but they don't, at least in the tables I found.

I understand that there is a convention born of convenience when SSB was just getting started. Apparently it was easier to build multi-band rigs for SSB that did upper and lower side band on various bands when this all got started but most of us don't build our rigs today.

Where can I find out what the convention here is for 160, 80, 40, 20, 17, 15, 12, 10, 6, 2 (and up) SSB phone operation?

Thanks!

I was considering another question and in a bout of laziness I figured I'd ask the group and not spend a few hours reading Part 97 trying to figure it out...

I use my assigned call sign to ID myself when operating my station, but what if I'm operating a station that's not mine? Can I just provide my call as identification or do I need to include the station's call too?

What FCC rule(s) speak to this situation?

I'm guessing that I have to provide the ID of the station I'm operating and my call being the control operator but what is the accepted format for that for the various modes: CW, Phone, Etc?

Extracted from the fcc question pool -- see google for "usb lsb convention" get a pdf file "Technician Study Sheet"

sez

Radio Modes

The simplest radio signal is just a single frequency. By turning that radio wave on and off, it's possible to send morse code (CW). Amplitude Modulation is the simplest voice modulation scheme but it's not very efficient because it has two identical (redundant) sidebands with the voice information and the radio carrier that doesn't contain any information. Amateur radios often use Single Sideband (SSB) transmissions that are spectrally (space) and power efficient by removing one of the AM sidebands and the carrier before transmission. This leaves either the upper or lower sideband (USB/LSB). Convention dictates that lower sideband (LSB) signals are used below 10MHz and upper sideband (USB) is used above 10MHz.

60M as you pointed out is USB

This answer applies to US hams, as some other countries have other rules.
     Our license have two parts, a Operator Privileges and a Station Privileges.

In principle, the station is licensed, not the operator. This probably has to do with remote station operations.

However, it often leads to some confusion, such as an interpretation that an Amateur who has no station does not have a license. Another quandary can happen if say a friend hands you his HT at say a Public service event. Do you ID with his call? His call. What about ownership of the station? If I check out a rig for my club that was donated to the club, that will be for sale, do I have to ID using a club call sign?

Okay, enough of that!!

In reality, we are identified by our call signs. If someone refers to N3LI, I'm sure to say "wassup"? Every station I operate with the exception of Field day and contesting at the clubhouse, I ID as my call.

> What FCC rule(s) speak to this situation?

I spent quite a while looking for just that, and there is no clear rule. There are some rules regarding operating another station when a person is operating outside their regular privileges, and upgraded callsigns. but precious little regarding the station vs operator issue.

- 73 de Mike N3LI -

The relevant section is �97.119 Station identification. The call of the
station must be used, "an indicator
consisting of the call sign assigned to the control operator's station must
be included after the call sign."

However, I don't think the FCC prohibits one amateur from lending his
equipment to another. So
you could take the position that the station owner has lent his equipment to
you, and during the loan,
it is your station, so you only have to use your call sign.

As I read it, that paragraph (3) applies only when the operator's license class exceeds that of the station licensee... and most seem to feel that it's required only if you're transmitting beyond the privilege level allowed by the station license.

>However, I don't think the FCC prohibits one amateur from lending his
>equipment to another. So
>you could take the position that the station owner has lent his equipment to
>you, and during the loan,
>it is your station, so you only have to use your call sign.

That seems to be the usual convention.

There seem to be several common practices, which I believe (speaking *not* as a lawyer) fall within the scope of what the FCC considers a reasonable interpretation of the rules:

- Use your own station callsign (the "borrowing/lending equipment" concept). This makes you fully responsible for the transmission.

- Use the station's own callsign, only. This seems to be legitimate if you're operating with the station owner's permission, and are transmitting within the privileges covered by the station's licensee or trustee (and your own, if you don't have a higher-privileged control operator present). This is a common approach used for transmitting at a club station... you use the club station ID.

- Use the station's callsign, slash, your own callsign. You'd do this if you want to actually ID the location you're transmitting from (e.g. a club station or that of a friend), but you're transmitting on frequencies which are allowed by your own operator class but not by the station licensee's class.

```

This also works as a weekend -- Friday, Saturday, and Sunday, testing
on Sunday, for people who can be motivated enough to read the ARRL book
outside class.

>Here's the real shocker for me: The VE team mailed the package back to
>the ARRL on Friday (11/30). The calls were in the FCC database
>yesterday (12/3). The ARRL couldn't have received the forms before
>yesterday, so that means that on the same day that the paperwork reached
>the ARRL the calls were issued.

The ARRL uploads into the FCC database directly, which assigns the calls.

Laurel VEC, which does Hamvention in Dayton, posts the calls of people
who take the test Friday ON SATURDAY. I asked how they do this, was told
Laurel gives the Dayton VE team authority to upload data themselves.
Sweet. The database is offline on the weekend, so Saturday testees have
to wait until Monday.

ARRL VEC side of operations has their heads on straight. Now if they
gave tests for free and let their VE teams upload ...

The story I heard is that this started because Collins radios had an IF of 9MHz and only needed one set of (expensive) sideband filters to have LSB below 9 and USB above. Mixing to get the final output: F1+F2 gives same sideband you start with, F1-F2 inverts.

That's what I was told.

: :
: : -= bob =-

I'm not sure I understand the question. Are you saying that if you visit someone else's shack and operate their equipment, you should use their callsign..?

Here in the UK the convention is to use your own call with the suffix /A (alternative address) i.e. "this is G6URP/A operating from the QTH of G3USA".

If however G3USA was licensed to use bands/modes I was not, I could operate on them under his callsign, but giving my own call as the operator. In this case I would complete G3USA's log not my own.

You were told wrong. That mixing scheme does not invert the
sideband.

This amateur radio urban legend has been around a while, but that's
the first time I heard it attributed to Collins.

Here's what really happened:

A few hams were using SSB in the 1930s. W6DEI, Ray Moore, was
on the ham bands with SSB in 1934 or earlier, and the use of SSB

is promoted in "200 Meters And Down", first published in 1936. But it wasn't until after WW2 (late 1940s) that SSB began to become really popular with hams.

The HF ham bands in those days were just 80, 40, 20, 11 and 10 meters. US hams didn't get 15 meters until 1953 or 54, and didn't get 30, 17 and 12 meters until after 1979. 160 had been a popular band before WW2 but it was reallocated to LORAN during the war and we got it back a little at a time over many years, with all sorts of restrictions, until LORAN was finally phased out.

40 meters had no 'phone segment until 1953/54, either. 11 and 10 were great as long as there were sunspots.

So the two most popular 'phone bands were 20 and 75, which were much narrower then than today. For some reason, the 75 meter SSB folks chose LSB, while the 20 meter gang went for USB. Most rigs of the time could do either sideband on either band, but the convention took hold early on and never changed. When US hams got 15 meters, it seemed natural for 15 to be USB, and when 40 got a 'phone band, it was equally natural for 40 to be LSB. It had nothing to do with Collins or 9 MHz IFs.

Now about the mixing scheme:

None of the early Collins ham rigs had a 9 MHz IF. Collins made mechanical filters, which were only practical up to about 500 kHz or so, and sideband choice with them was a simple matter of switching a BFO crystal.

Some early SSB transmitters did indeed generate SSB at 9 MHz, and then heterodyned it to 75 or 20 by mixing with a VFO in the 5 MHz range. But that mixing scheme *does not* invert the sideband! If you take a 9 MHz SSB signal and mix it with a 5 MHz VFO signal, you'll get the same sideband out of the mixer as you put in, regardless of whether you add for 20 or subtract for 75. The VFO will tune backwards on 75, but the sideband will not invert. Those early rigs all had USB/LSB switches in order to match the convention.

The only way to get sideband inversion by mixing is if the local oscillator frequency is higher than both the input and output signal frequencies. The 9 MHz-IF story isn't just an urban legend - it flat out doesn't work.

It *is* true that if you generate SSB in the 5 MHz region and mix it with a ~9 MHz VFO, you'll get the desired sideband inversion. Some 1960s SSB rigs used that scheme - but they were long after the convention was in place. And the urban legend doesn't mention those rigs.

If you want to see the math on how all this works, I can post it.

[snip]

ISTR that early Swan transceivers offered only USB for 20, 15, and 10,
and only LSB for 80 and 40. They say the memory is the second thing to
go, but perhaps that was where this convention got started.

BTW, given a choice between LSB and USB, the military's preference is
for Upper sideband, since using USB makes it easy to talk another
station on to a net frequency: if his voice sounds high, then so is his
frequency.

HTH.

You are correct, sir! But they were not the only ones to do that - National and some others did too. The early Heath monobanders had no sideband switch, for example.

Swans used IFs in the 5 MHz range.

> They say the memory is the second thing to
> go, but perhaps that was where this convention got started.

The problem is that by the time Swan showed up in the early 1960s, the standard was already in place. And later Swans let you use either sideband.

The 9 MHz IF/ 5 MHz VFO system was popular in the 1950s. The Central Electronics 10A, 10B and 20A exciters all used it, as did the popular W2EWL SSB rig featured in the article "Cheap and Easy SSB". You'd think those popular rigs would have caused the standard to be that the same sideband would be used on both 20 and 75, because they don't invert the sideband. Swan would then have been bucking an established trend. Yet the opposite is true. I suspect that Swan chose their heterodyne scheme to save a little money by not needing a second BFO xtal nor a switch.

IMHO, there's also the simplicity. If everyone is on USB, regardless of band, you don't have to think about which one to use, or even provide a choice.

I cut my 40/15m dipole for 7.07/21.21 MHz. I don't recall the callsign of
the G3. Check out some of the nifty calculator programs on www.smeter.net.
I used two... one for the cage dipole/inv-vee and one for a lambda/2
vertical for 20m. I use Davis RF (I have no connection with them) for my
wire antenna parts. I found my local metal supplier *stocks* a good variety
of aluminum tubing. I'll use them as a source of materials to resurrect my
15m/3el homebrew yagi for the upcoming sunspot peak.

Yes, It sure does. Common sense seems to rule the day if you ask me. This question came up in a discussion about what the ID requirements where for operating the club station here at work. I was told that all I needed to do was use my own call, but be sure to log my activities in the station log. I guess they work under the "you are borrowing the station" when you operate it, but something just didn't sit right with me. If I'm required to log my activities into the station log but only identify with my call something didn't make sense and it didn't make sense to me just to use the club call when I'm using the station for my own thing.

So, here's my "let's be totally careful" approach given the discussions I've seen so far..

In all cases, I will log my activities into the club station's log because the station trustee has requested that I do so.

For identification I will:

IF, I'm just operating the club station on my own and not participating in an officially sanctioned club activity I will identify with *both* calls, the club first followed by mine.

IF, I'm operating the station during an officially sanctioned club event, I will identify with the club call only and log that I was the control operator.

That sounds pretty safe to me based on what I've seen thus far. (At least here in the USA..)

That's fine. Perhaps overly-conservative, but it seems like a fine operating practice.

>IF, I'm operating the station during an officially sanctioned club
>event, I will identify with the club call only and log that I was the
>control operator.

That's safe, I think, *if* the club's trustee has a license class equal to or greater than yours.

If not, then if you're transmitting in frequencies allowed by your privileges but not by the trustee's, then you *must* take the more-conservative approach of transmitting the club station's call, stroke, your own callsign.

Otherwise, you'd end up with a situation in which listeners (possibly including the OOs or the FCC) would hear an ID in (e.g.) the Extra portion of the band, from a callsign belonging to a station which has (e.g.) only General privileges. That could result in a letter from Mr. Hollingsworth to the trustee, stating that the station had been transmitting outside of its license privileges and asking for copies of all of the logs, etc. That's the sort of situation best dealt with by prevention :-)

Alan WA4SCA wrote:

> Jack,
>
> The first thing to check is that the interface is FULLY isolated.

I don't agree. If the problem was in the interface, it would work equally badly with the desktop, laptop, or laptop on batteries. The thing that Jack did to resolve the problem was to disconnect the power supply from his laptop. This implies to me that the issue is RF getting into the computer via the AC power line. Or in the case of the laptop, it could be that the RF is getting into the system because the cable between the power supply and the laptop is acting as an antenna.

That's the aspect that I would work on. It sounds to me like RF is getting into the computers. When the laptop is running on battery, it's sufficiently shielded so that it's able to operate. If the desktop has a metal case, it might be that bypassing the AC feed would help. Shielding the cable between the laptop's AC supply and the laptop might help. Even moving the physical location of the various components may help.

One of the things that tends to poke a hole in this whole theory is the fact that Alan is running QRP. If there were a lot of RF floating around the shack, my idea would make more sense. On the other hand, computer equipment is remarkably sensitive to RF at specific frequencies, and Murphy suggests that that's where you're operating . . .

The whole concept of grounding is probably fertile ground for
investigation for this problem.

Thanks for the input guys.

I am using a Buxcomm rascal interface (I had forgotten the make, but have been reminded since), which apparently has excellent isolation.

The problem occurs equally on all HF bands, so is not really frequency specific.

If its a stray RF problem, which I am very willing to accept, I'm surprised that it effects two very differently designed computers in exactly the same way.

This is a FAQ in the audio world. It is a very common problem with getting audio into and out of laptops. Their "brick" power supplies are notoriously noisy. At AF frequencies, and likely RF, as well. In the audio world, we use full transformer isolation in and out. (Or else use an inexpensive USB-powered audio interface. Likely cheaper than trying to isolate the PSK31 interface.)

Not the CPU's fault. It is almost guaranteed to be the "brick" power supply. Note that the problem goes away when you disconnect the "brick" and run on the internal battery supply.

I bought a used "brick" power supply for this Dell laptop on eBay and it came with an intermittent (3-pin U-ground) mains power plug. So I chopped it off and replaced it with an after-market, 2-prong plug and I don't have problems with ground loops and RFI from the garbage power supply anymore.

Yeah, yeah, green-wire "protective ground", etc. etc. Well, I don't see what exactly the "protection" here is doing, and if the green-wire ground WAS supposed to be there for RFI shielding purposes, then why does it *go away* when I disconnect the green-wire ground? Riddle me that! :-)

Well it will be double insulated so doesn't really need an earth at all.
I'm surprised there was one.

Jack

The green wire isn't there for RFI purposes. At least not primarily.

It's there mostly for safety purposes. In case something fails inside the power supply, the system cannot become hot-to-ground.

RFI prevention is secondary.

> RFI prevention is secondary.

RE the misbehaving unit:

Jack, you probably have a number of problems going on, so I'll outline some things you can try, and try them one at a time, so you can troubleshoot which one might cure the problem. Some you may already have done.

Pull the audio out cable from the laptop and have a listen to the signal while transmitting both with and without the power supply attached. Sound okay - the same- both times?

Get the computer and transmitter on the same mains line.

Isolate, isolate, Can you get a line isolator on that power supply, or possibly make up a cable to run the laptop off a good power supply?

I don't know how the power plugs are in your QTH, but if you are 2 pronged no neutral, you can try reversing the plug on the Power supply.

This probably isn't the problem, but some clip on ferrites on the DC end of the power supply can't hurt.

Can you try another laptop PS?

- 73 de Mike N3LI -

Just out of curiosity, does this happen when the batteries are removed from the radio also? Try carrying the batteries in a separate battery holder next time and see if they suffer the same fate.

OM's

visiting the group i read that Antique Modulation is out

Of course there will be a reason use of bandwith?
However there are groups of OM that are interested in W.O. 2 equipments and even shipradio
They may not use their Rigs anymore?
Only because young newcomers dont understand history and can not tune with their modern SSB rig
19 sets or ARNC s old aircraft sets like TR 2200 wil be forbidden
We are also amateurs who love a part of the hobby

The band plan is merely a suggestion for use in those countries that have not developed their own band plans. It does not ban AM voice. In those countries that already have band plans such as the US, Canada, etc, it does NOT supersede them.

```

Hi, I did some searches on google for grounding, but all the information I have found talks about grounding antennas and such against lightning strikes. But the grounding I am interested in researching is the type of ground I would use on my HF radio, power supply, and antenna tuner. I haven't grounded anything yet, but I would like to. I seem to have a hazy recollection of reading somewhere that I should use copper braid and connect it to the house ground. But during my search I found this image (which basically sums up the article it came from) http://www.qsl.net/n5nj/kuby/image16.gif

Does it really matter if my equipment is ground to the house ground or should it really be connected to its own external ground? And if/when

I ground to guard against lightning strikes, would I use that same
external ground or go with yet another external ground?

I'm still doing my research, but figured it couldn't hurt to ask.

Thanks!

Jim

Jim,

You'll see numerous references on the web to "single point ground." It is very, very important stuff. I got nailed on this stuff back in August, 2003. Here's how it played out:

We had a violent thunderstorm early one morning about 7 A.M. Suddenly there were three near strikes (simultaneous lightning and thunder) within a ten second time frame. In addition to telephones, computers and home entertainment equipment, my four month old Ten-Tec Orion and numberous shack accessories were zapped. My house ground is a single 8 foot copper plated ground rod. The lightning ground for the shack was an identical ground rod driven about thirty feet away from the house ground.

When the strikes conducted a surge into my home via the power lines, all three wires had very high voltage on them. The shack ground was still at its usual potential (0). The house ground was elevated to high voltage. There was a potential difference between the shack ground the the house ground. That potential quickly equalized inside my equipment.

Ten-Tec reported that six boards inside the Orion had their ground traces evaporated.

For a shack ground, you want the shortest possible distance between your rig and earth. The house ground will be as close as possible to your electrical service entrance. If, like me, you have to use two ground rods, you need to bond the two of them together with a big, fat wire so that the two can never be at different potentials.

If you have a tower, I'll assume that you have at least one 8 foot ground rod driven at its base. Bond your coaxial cable sheaths to the rod at the tower. The sheaths should also be bonded to your shack ground.

Dave Heil K8MN

my own experence is that using the household ground at hf is marginal at best

my own result were greatly inproved with aan extrenal seperat e ground

Hi James,

There are several good articles at the www.eham site on this very subject. If you can read between the lines of some of the muck slinging, you can come up with several really good solutions.

Just click on the "view more articles" link [at the top of the horizontal
green separator] HTH.

Alain

There are two grounds for your radio system. There is an RF ground, and there is a power ground. They aren't the same, and even the term "ground" is a little nebulous. But it is convention.

Dealing with the Power ground, you'll want to tie the grounds on the back of your radios/tuners/amplifiers together. There are a number of ways to do this. Some folks construct a copper ground plane that has wires running to it from the equipment needing grounded.

Another possibility is wiring to the grounding bars such as are used for electrical service. This is the method I use.

Whatever method used, short wires are better working practice.

I'll just go over my own setup as beyond the grounding bar, you'll get a lot of opinions on what is right. I run heavy gauge wire out to a 8 foot copper pipe embedded about 7.5 feet into the ground, and have ground clamps to attach it. Braid is good too.

Some other thoughts:

I install the pipe hydrostatically - I sweat a garden hose adapter onto the copper pipe, attach a hose to it, and let 'er rip (hopefully no disclaimers needed here) The water digs a hole for the pipe, which then sinks into it. It's fun

some folks ground to a water pipe. Not a good idea, as modern plumbing does not always have continuity - there might be a piece of PVC in the line somewhere.

I have my Arrester going to that pipe also. I'm using a "spark gap" type arrester, but I would really recommend one of the gas discharge types. They are quick to respond, and better protection in general.

Hope this helps.

This whole topic area seems to be eternally confused and confusing and
I'm in the parade of the confused. On a common sense basis I
absolutely agree with your connecting the station grounds to the
'lectric service entrance ground for the reasons you've stated.

But somewhere along the line somebody in the ham groups stated that
the National Electrical Code states that there shall be one and *only
one* grounding point per power drop and the neighborhood code cops and
the insurance companies reportedly get stiff about it.

So is it legal to connect a phalanx of ham station ground rods to the
service entrance ground?? Or not.

As I understand it, according to the NEC, you must have only one grounding *system* per building. This system may include two or more ground rods, and/or a bare grounding wire buried in a trench around the outside of the building. The ground rods and wires must be securely bonded together with heavy-gauge wire... that's what ensures that it's all one grounding "system".

What's dangerous is, as has been suggested, having separate grounding rods (or grounding subsystems) which aren't well-bonded together. If you connect any electrical apparatus to two such grounding points (e.g. ham radio with a third-prong ground on its line cord, which is also tied to a separate ground rod via the coax feedline), and a lightning strike or a hot-to-ground fault occurs, your electrical apparatus and its wiring can end up carrying a lot of current between the ground points, thus creating a shock or fire hazard.

The bonding wires create a low-impedance path for such fault currents, minimizing the voltage differential which exists between the ground rods and thus helping keep down the flow of fault current through undesired paths (e.g. your ham rig).

> "ground" is a little nebulous. But it is convention.

The is probably the biggest point of confusion for me. What do you mean by "RF ground"? The type of ground I was asking about is the ground terminal on the back of my radio,not the three prong power plug. There is the ground terminal on the back of my radio and there is also a ground terminal on my power supply, even though both have three prong power plugs. So, are the ground terminals on the back of my radio and power supply called RF ground, or are the called Power ground? Because I thought that the power ground was the three prong plug.

Jim

The intent of the third prong on the power plug is to provide a safe path from the equipment chassis, back to the power panel (where the neutral and hot are bonded together). This ensures that if there's a fault inside the equipment, and a "hot" wire touches the chassis, the stray current will immediately flow back to the panel via this ground connection (and likely cause a fuse to blow or a breaker to trip very quickly). It ensures that you don't end up with a chassis which is "hot", and isolated from ground... just waiting for somebody to touch it, accidentally complete a path to ground via their body, and get themselves mildly dead.

The intent of the ground terminal on the back of the radio is to let you tie the radio chassis to a good RF ground, so that if any RF reaches the chassis via conduction (e.g. coming back down the feedline) it doesn't leave you with a chassis which is RF-hot compared to grounded objects nearby (this could cause an RF burn if you touch the chassis, or sneak back into the microphone wiring and cause weird squawking sounds when you transmit). It's also necessary if you plan to use a random-wire or similar unbalanced antenna which is designed to work against the station ground (e.g. radials or counterpoises).

It's normally the practice to bond *all* of the equipment in your shack together with good (short, heavy) grounding wire or braid... once again, ensuring that different pieces of equipment have their chassis at the same (or nearly the same) AC and RF potential. By doing so, you are in effect bonding together your power/safety ground, and your station RF ground, creating a single ground system.

Because this in-the-station ground bonding isn't really designed to handle massive amounts of fault current (e.g. from lighting) and since it's in an area where you really don't want such fault current to flow (e.g. your shack), it's still important to bond your station's "RF ground" rod, and your house's service-panel ground rod, together as per NEC.

```

>
> The is probably the biggest point of confusion for me. What do you mean by "RF ground"?

It is confusing, so you're not alone.

RF grounds can be related to Power grounds, but only so far. On say a ground plane antenna, where you have a vertical center rod connected to the coax center conductor, and some angled rods connected to the coax shield, those angled rods are serving as a ground plane. They aren't connected to actual earth.

This is where a lot of the confusion comes in. The ground plane is more of a counterpoise, or to look at it as a circuit, a place for the other part of the current to go.

Now if we look at say a vertical HF antenna of the 1/4 wave variety, typically this antenna will have "grounding" by way of many radial lengths of wire that are either buried in the earth at a shallow depth, or even just stapled to the surface of the earth.

This is "Kind of-sort of" like a power ground, in that it is in the earth, but its doing something different. It is operating very similarly to that ground plane. It gives the RF current a place to go.

I didn't go into things like impedence to avoid confusing the issue, but that would be next in the discussion.

The type of ground I was asking about is the ground
> terminal on the back of my radio,not the three prong power plug. There is the ground terminal on the back of my radio and there is also a ground terminal on my power supply, even though both have three prong power plugs. So, are the ground terminals on the back of my radio and power supply called RF ground, or are the called Power ground?

The ground terminals on your equipment are part of the power ground, that you would attach to the pipe in the yard. Explanation of that below. Any RF ground would be considered to be on the shield of the coax connectors.

> Because I
> thought that the power ground was the three prong plug.

Yes, generally. One of the reasons that we put in a separate ground rod from house ground for a power ground is that there can be currents on it after going around the house. It's still mostly neutral, but with hundreds of feet of that green wire running around the house, you can still get some currents.

Some people can "get away with" not having a station power ground. Kinda. I highly recommend one especially for some place to send your lightning protection.

One of the reasons that Ground fault interrupters are around. If you have a hundred feet or even more of neutral wire going back to that panel, you can still get an appreciable current flowing through you without tripping a breaker. I've had my tookus saved by one of those GFCI things when a power tool failed in the manner you just described. I felt the shock for just a fraction of a second, then it tripped.

> the chassis, or sneak back into the microphone wiring and cause weird
> squawking sounds when you transmit).

Ahh, that happens to me all the time even without RF on the mic! ;^)

There is a whole lot of misinformation regarding grounding. An interesting mental exercise is taking a tower say 50 feet from your house. According to some, in order to comply with NEC, the tower has to be grounded by sending a lead back to the house to that single ground point. I guess they want to insulate the tower base from ground - no ufer's here, thanks. Sounds like a disaster waiting to happen.

The good folks at Polyphaser have some excellent Technical notes. Kept me busy a long time reading the stuff:

http://www.polyphaser.com/technical_notes.aspx

Of particular interest is Ham Radio Station Protection:

http://tinyurl.com/2aymw9 (tinyurl needed - its a long one)

It is largely about lightning protection, but has good stuff pertaining to grounding.

. . . .

Makes complete sense and answers my basic question. Thank you David.

I have five 8' ground rods already installed with more coming. All of them will be bonded together with about 100' of #8 bare solid copper.

Let's try one more: This place is a "This Old House" type abode. There is no basement and no visible service entrance ground rod. There's a tight dirt crawl space under the place which I'm not about to even try to wiggle and squirm through to find the power wiring ground connection. If there is a ground it's the 3/4" copper water supply line from the street which pops up somewhere in the crawl space per normal practice in days of yore around here. I know for a fact that it's an old ~80' 100% copper line, not plastic. On the other hand the service entrance panel box is quite accessible. Would it be OK if I connected my ham grounding system to the neutral/ground bus in the panel box instead of to the water line??

the NEC refering only to the household AC wring(soon hopefully to DC circuts

at least according to the local electrical inspector

our system for RF are another affair all together

the inspector also aprooves the use if desired of seperate eletectal ground
when service of more than one voltage and/ot freq is ainvolved

in my case I have a houshold from the ower company enterance a seprate
gorund for my various solar and wind systems 12-48 v DCdepending on the
location plus the seperate Ground from my station

most inspector in my experence would rather our rf system were not grounded
in to the mais ground since they don't uderstand RF at all

Of course.

Over the years I've dealt with a grand total of two lightning "events". I had a 70' 45G tower with a monster mast which was topped by a homebrewed clone of a 2M Ringo Ranger which went to 90+ feet. Lightning magnet. There was one ground rod alongside the concrete base which was bonded (clamped and silver soldered) to the tower by a 1/8" x 1/2" copper strap.

There were three runs of coax, a run of shielded rotator cable and an unshielded run of 14/3 Romex up the tower with all shields and the Romex ground bonded to the tower. All the radio gear in the basement shack was grounded to the water line which was ~25' from the radios. Not slick by today's standards.

Along came the first hit and my whole world turned "bright electric blue". Power line/brown underwear hit. The thunder was still rumbling loudly so I scrambled behind the gear and furiously got into yanking plugs out of outlets when *bang* another hit . .

In the end there was all kinds of damage to the house wiring, TV sets and kitchen appliances toasted, second floor wall outlets atomized, etc. The only damage in the "radio room" was to the two vaporized disc ceramic AC line bypass caps in the 75A4.

>From this experience I learned that (a) lightning certainly can strike the same place twice in rapid succession and that (b) lightning can choose to hit power lines which are 30-40 feet *below* mongo grounded objects like a towers which makes no sense at all and (c) there are no manmade "cures" for lightning. Except maybe paid-up insurance coverage and prayer . .

Erp. Yes, indeed! Bonding neutral and hot at the panel would be
spectacular, but rather useless :-)

Xref: g2news1.google.com rec.radio.amateur.moderated:1946

Based on the period of 3 March 2007 to 3 December 2007, the US amateur radio individual licensee totals have changed as follows:

New: 20,901   Expired: 19,739

Compared to an averaged 9 month period prior to 3 March 2007:*

New: 16,957   Expired: 21,822

The total number of individual licensees was 711,175 on 3 Mar 07 and that changed to 711,892 on 3 Dec 07 for a net gain of 717 in nine months. That is a 0.1% growth rate.

* Prior 12 month period total changes divided by 12, then multiplied by 9 to approximate a 9-month averaged period for comparison.

In short, nothing much has happened to numbers, no significant changes either way. Class changes are another matter. All data obtained from www.hamdata.com FCC Information page.

73, Len AF6AY

There are those who think it's not sporting, but ftp clusters, such as K3LR offer "up to the minute" DX as it is spotted on the bands. Go to ac6v.com to find a nearby cluster, as well as info on how to customize them for your geographic area.

I've had moderate results with 125 watts and a 70-foot-long end fed "zepp" antenna by using the 75-meter SSB DX "window" at 3790-3800 kHz. Usually good for insomniacs, as the Europeans wake up at 1-2 AM CST. DX comes through very close to 3500 KHz, too.

DX contests, such as the recent CQWW, bring them out of the woodwork. I heard tons of European and African stns on 80 during the CW contest. Never heard them there before, but I'll check the contest calendars from now on... Good Luck!

I was going to followup to the original article that I posted on October 22 <13hpelos43h30b5@news.supernews.com> but I no longer have it locally. In that article I asked for advice on teaching an entry-level ham radio class, and the resulting thread was a big help. I appreciate the comments. Here's a short status on how things went.

The class consisted of six sessions held on Tuesdays and Thursdays, so it lasted three weeks. The last session was the Thursday before Thanksgiving, so we took that week off, then the students asked for a review session the Tuesday after Thanksgiving before the exam, which was Thursday, November 29.

Five new hams came out of the exam session, plus one upgrade from the local ham population (General to Extra). Seven people took the test, so two didn't make it. Of the two, one of them missed by only one question so he decided to try it again that night; the second attempt didn't work for him either.

Here's the real shocker for me: The VE team mailed the package back to the ARRL on Friday (11/30). The calls were in the FCC database yesterday (12/3). The ARRL couldn't have received the forms before yesterday, so that means that on the same day that the paperwork reached the ARRL the calls were issued. I went to the FCC website yesterday just to be sure that I remembered how to do a search by name and was astounded when the entries for these new hams showed up. That's impressive.

Other comments: I liked the format of six 2-hour sessions. The students also expressed their approval, but that's not too useful since they tend to be self-selected; only people who can fit six sessions into their schedule were there. I found that I could cover two of the sub-elements from the pool in a bit over two hours and had time to present general background information and also go over the specific pool questions.

I was reasonably satisfied with how the presentation broke out in terms of covering concepts and reviewing specific pool questions. We had time to do both, and I felt that both were valuable to the students.

All in all, I found it to be a rewarding experience for me, and the look on the face of one of the students when she was informed that she had passed the test was, as they say on the TV commercials, priceless. Now the next step is to get these new hams on the air.

73, Steve KB9X

Thanks for the followup report. Do you have an outline or
teacher's notes that you could share with others who want
to do a similar project?

```

These are the number of current, unexpired FCC-issued amateur radio licenses held by individuals on the stated dates, and the percentage of the total number of active licenses that class contains.

Percentages may not add up to exactly 100.0% due to rounding.

These totals do not include licenses that have expired but are in the grace period, nor do they include club, military and other station-only licenses.

Effective April 15, 2000, FCC no longer issued new Novice, Technician Plus and Advanced class licenses, so the numbers of those license classes have declined steadily since then.

Also since April 15, 2000, FCC has renewed all existing Technician Plus licenses as Technician. It is therefore informative to consider the totals of the two classes, since the Technician class includes a significant number of Technician Plus licenses renewed as Technician.

On February 23, 2007, the last Morse Code test element, the 5 wpm receiving test, was eliminated as a requirement.

The ARS License Numbers:

As of May 14, 2000:

Novice- 49,329 (7.3%)
Technician - 205,394 (30.4%)
Technician Plus - 128,860 (19.1%)
General - 112,677 (16.7%)
Advanced - 99,782 (14.8%)
Extra - 78,750 (11.7%)

Total Tech/TechPlus - 334,254 (49.5%)

Total all classes - 674,792

As of February 22, 2007:

Novice - 22,896 (3.5%)
Technician - 293,508 (44.8%)
Technician Plus - 30,818 (4.7%)
General - 130,138 (19.9%)
Advanced - 69,050 (10.5%)
Extra - 108,270 (16.5%)

Total Tech/TechPlus - 324,326 (49.5%)

Total all classes - 654,680

As of November 1, 2007:

Novice - 20,916 (3.2%)
Technician - 291,761 (44.5%)
Technician Plus - 22,806 (3.5%)
General - 142,680 (21.7%)

Advanced - 66,117 (10.1%)
Extra - 111,736 (17.0%)

Total Tech/TechPlus - 314,567 (48.0%)

Total all classes - 656,016

As of November 12, 2007:

Novice - 20,789 (3.2%)
Technician - 292,048 (44.6%)
Technician Plus - 22,322 (3.4%)
General - 141,496 (21.7%)
Advanced - 65,898 (10.1%)
Extra - 111,733 (17.1%)

Total Tech/TechPlus - 314,370 (48.0%)

Total all classes - 655,286

As of November 25, 2007:

Novice - 20,666 (3.2%)
Technician - 292,686 (44.7%)
Technician Plus - 21,874 (3.3%)
General - 142,450 (21.7%)
Advanced - 65,698 (10.0%)
Extra - 111,760 (17.1%)

Total Tech/TechPlus - 314,560 (48.0%)

Total all classes - 655,134

Changes:

>From May 14, 2000, to February 22, 2007:

All the materials that I used in the class are available at
http://www.beebear.com/RadioClass/

I quickly admit that there is very little original material there. I used material that is available on the net from several sources, adding my own flavor. I apologize for a lack of instructor notes (like the 100-foot extension cord and the paddle/keyer used as instructive aides) but it never occurred to me that anyone would ask. If anyone wants the

actual source presentations (there are PDFs on the web site) drop me an
email.

Interesting numbers, Len

We have a continuation of the dropoff of (almost certainly) inactive Hams. Not too surprising there, if a person subscribes to the idea that a lot of folks who once used 2 meters as a sort of "pre cell phone cell phone" had migrated over to cell phones to get their communication needs taken care of.

I think that that will continue until around 2009-10.

The number that I think is most important is the new license numbers. People are still getting licenses, and at a healthy rate.

The above numbers include licenses which have expired but are in the 2
year grace period. AF6AY is using the term "expired" in a different
way than FCC defines it. Hamdata.com avoids the confusion by using the
phrase "no longer licensed".

>That is a 0.1% growth rate.

> In short, nothing much has happened to numbers, no significant
> changes either way.

IMHO, it is significant that the license numbers were slowly decreasing from 2003 to 2007, and are now slowly increasing. The growth may be slight but at least it is not a loss.

> Class changes are another matter.

Let's take a look:

Using the number of unexpired current licenses held by individuals (not including those in the grace period) the license class changes expressed as a percentage of the total number of licenses from Feb 22 2007 to Nov 25 2007 are as follows:

Novice: decreased from 3.5% to 3.2% - loss of 0.3%
Technician: decreased from 44.8% to 44.7% - loss of 0.1%
Technician Plus: decreased from 4.7% to 3.3% - loss of 1.4%
General: increased from 19.9% to 21.7% - gain of 1.8%
Advanced: decreased from 10.5% to 10.0% - loss of 0.5%
Extra: increased from 16.5% to 17.1% - gain of 0.6%

Combined Tech/Tech Plus: decreased from 49.5% to 48.0% - loss of 1.5%.

Since no new Novice, Tech Plus or Advanced licenses have been issued since April 2007, their declines due to attrition, upgrading and the renewal of all Tech Plus as Technician are to be expected. Note that none of the license classes experienced a change of more than 1.8%, and most experienced changes of less than 0.7%.

Any electrical contractor will tell you that not all electrical inspectors are well educated or trained. Ive had electrical inspectors state a preference for plastic boxes in a run of metallic conduit or cable. What those inspectors preferred was a direct violation of the National Electrical Code. I've had electrical inspectors try to order me to make a grounding connection in the meter enclosure which was totally unacceptable to the power utility and is not required by the NEC. I've had an electrical inspector fail my installation because I had made the Grounding Electrode Conductor connection to the service entry neutral conductor drip loop to comply with the requirements of the legacy Rural Electrification Administration (REA) power cooperative service standards even though the National Electrical Code specifically permits that location to be used.

What the electrical inspector may prefer may be directly adverse to your best interest. Bond all of your Grounding Electrodes together even if your have to wait until after the electrical inspection to do so.

It is not necessary to bring your bonding conductor to the inside of the
panel cabinet. Bonding it to the cabinet itself is sufficient. If any
portion of the Grounding Electrode Conductor is accessible then that is
the best place to connect your inter electrode bonding conductor.

The decrease in license numbers at that time very well might have been due
to the uncertainty of the demise of element 1. I know several new hams
that waited for it to go away.

Mike, I wasn't presupposing any reasons for individuals to let their licenses expire. Expirations are expirations. There's no proof or anything else that all or some majority expirations come from Technician class (the ones that supposedly used 2m as a cell phone substitute).

I used www.hamdata.com primarily because that website does sort out new licensees and expirations from the huge singular daily amateur radio license database available from the FCC. QRZ and some other amateur-oriented websites do different sorting. The ARRL website listing only has sorting by 'active' license status, class, and state or province, does not indicate 'new' nor expiration nor class changes nor 'other administrative changes.'

ALL of these amateur-oriented statistical data services come from the SAME public database information. That database contains enough sub-data fields to derive all kinds of sorting. Some of that sorting would require temporary storage of past database information to show changes. The ARRL sorting is perhaps the simplest kind since it requires no storage of previous database information, taking only the 'active' individuals licensees out and sorting them by license class and geographical locations.

>The number that I think is most important is the new license numbers.
>People are still getting licenses, and at a healthy rate.

Well, at a 0.1% growth rate over 9 months, 'healthy' would be a rather subjective descriptor, wouldn't it? :-)

At least they are INCREASING what was a LOSS rate, not a growth. In the year prior to 3 March 2007 the number of expirations was 29,096 versus newcomer total of 22,605. That's a negative delta of 6,487. The positive delta over 9 months since 3 March 2007 was only 1,162 (20,901 newcomers v. 19,739 expirations).

Not having the exact statistical breakdown of any licensee numbers insofar as 9 months prior to 3 March 2007, I simply used the One Year prior available numbers and did simple arithmetic (multiply by 3/4) to find a comparative change of newcomer v. expirations. That turned out to be 21,822 expirations v. 16,957 newcomers, still a negative delta and a 4,865 average drop to total licensees in the same 9 months. In probability and speculation, without the elimination of the code test as ordered on 19 December 2006 (R&O FCC 06-178), the total licensee numbers would still be decreasing.

What would be more indicative of 'health' might be a more detailed sorting of public database information as to newcomers achieving what class license as their first. As a part of that, it would be nice
to see how many and from which class does a license class change within some time period. That seems to me to be more indicative of newcomers interest and the probable future of amateur radio in the USA once normal human attrition has taken care of the rest of us. If that probable future turns out to be different than what the devotees of the 60s and 70s newcomers did, then it is just different.
Such difference in perference would not be a 'moral flaw' of newcomers despite what some boomer-generation-newcomer licensees express now.

The future of USA amateur radio belongs to the newcomers of now. I think that the relatively minor number of existing licensees who ARE doing things for newcomers, such as Steve Bonine described in another thread here, are an EXCELLENT example of what should be done...positive steps, proactive steps to help, not hinder newcomers.

73, Len AF6AY

I appreciate the kind words, Len, but I think that we all need to realize that the ham radio hobby as we know it is changing. Of course, that's no different than at any time in the past, since ham radio today is different in many respects than ham radio of previous generations. Like any other technology-driven activity, things have changed and will continue to change. Can you imagine how amazed someone from the spark-gap era would be if they were transported into today's world with its tiny multi-function DC-to-light transceivers? [And just as if to underscore how common that technology has become, when I misspelled "transceiver", my email client underlined it for me, and provided the correct spelling.]

There is, however, an aspect of change these days that is different than what the hobby has ever experienced, and it's related to the topic of this thread. The reality is that during the next decades the number of active ham radio operators is going to decrease. We can massage the numbers and wring our hands, but there are two absolute facts that we cannot change: (1) The ham population is aging, (2) The general population is less interested in ham radio than before.

Perhaps some are unwilling to accept the second statement as a fact, but I think you're deluding yourself if so. Historically, most recruits into the hobby came from young folks, and this demographic is simply not as fascinated by radio as in the past -- they have many alternatives vying for their spare time. We are getting more middle-aged and retiree recruits than ever before, but even this population has many potential ways to spend their spare time and ham radio has to compete.

But the big item is the current age of the ham radio population and the fact that the same forces that are competing for spare time in the general population apply to already-licensed hams. Analysis of number of hams licensed is valuable but it doesn't tell the whole story. How many licensed hams have gone inactive? There's no way license numbers can tell us, but there are other statistics that do shed a little light on it. I'm thinking about things like the number of entries in contests, or the number of voters in ARRL elections. The problem with these statistics is that they measure only one very narrow segment of the hobby, but at least they're not falling off significantly. Yet.

I apologize for rambling, but the point is that I believe that the number of active hams will decline significantly sometime in the next 10-20 years. I base this on what I see at hamfests (the ones that haven't already folded), club meetings, and on the air -- almost all the active hams I run into are at least 50 years old, and many are 70-80 years old. These guys (yes, almost all are male) simply will not be active hams in 10-20 years. The best of recruiting cannot balance this single fact.

On the other hand, I'm not sure that there's anything specific to be done based on a belief that the number of active hams will decline. Our local club is considering going from monthly meetings to quarterly meetings; I don't think that's a good idea but it's the sort of thing that we may see more of in the years to come. Maybe if we recognize the reality of a shrinking active-ham population, we can come up with logical and realistic reactions.

How would that indicate the 'health' of amateur radio, Len?

Whenever multiple entry-level license classes have been offered in the USA, most newcomers have usually chosen the license class or classes that were easiest to earn. That way they could sample amateur radio without a big investment of time and effort, and learn-by-doing.

Of course some newcomers have bypassed the easiest-to-get license classes and started out as Generals, Advanceds or Extras. Nothing wrong with that, but how is it a measure of the 'health' of amateur radio?

> Such difference in perference would not be a 'moral flaw' of

What does that mean, Len? Of whom do you speak?

> The future of USA amateur radio belongs to the newcomers of now.

But not just to the newcomers.

The future of USA amateur radio belongs to all who are interested and active in amateur radio, regardless of age, experience, license class, or their particular area of interest in amateur radio. Simply being a long-time-licensed amateur does not make someone irrelevant to the future of amateur radio.

I agree that KB9X has done and is doing good things. But I think the number of "existing licensees who are doing things for newcomers" isn't minor at all.

Interesting theory! I know at least one ham who waited for Element 1
to go away, too.

If there's the possibility that the "price" of something will drop in
the near future, "sales" of that item often drop as people decide to
wait and see.

The number of US hams rose from early 2000 to mid-2003, then began to
decline almost exactly when the ITU treaty changed.

But correlation is not causation. There are any number of possible
reasons for the changes, ranging from sunspot decline to economic
factors to inexpensive cell phones and broadband internet.

The big question is whether the growth will continue long-term.

In my area in the past two months, we have picked up dozens of new amateurs who are in their late teens/early 20's. That is a surge, normally we pick up a few per month. But we have no problems with expecting plenety of QCWA members 25 years from now.

> We are getting more middle-aged and retiree
> recruits than ever before, but even this population has many potential
> ways to spend their spare time and ham radio has to compete.

We have been getting some oldsters too. The amount they spend per capita is shocking at times, and their enthusiasm and willingness to get involved is a great help.

The concept of the child getting their license is over rated IMO. And these days and in this world, a child siomply could not get much of the experience available. I remember when I was a young'un, friends and mysel hiking up the hill to the fellow who had the cool CB station with a tower and one of those directional three pronged verticals on it. We spent hours with the gent, happy and safe.

These days if you are going to spend time with youth, you'd better have a person with you and have passed one of the State Police background investigations. An approved escort should be with the child at all events.

> I apologize for rambling, but the point is that I believe that the
> number of active hams will decline significantly sometime in the next
> 10-20 years. I base this on what I see at hamfests (the ones that
> haven't already folded), club meetings, and on the air -- almost all

I've been in the hamfest discussion, with older Hams, newer ones, and I've come to the conclusion that a large part of the reason that Hamfests go away is that they start too early and end WAY too early also.

These days if you get to a Hamfest at 11:00 a.m. you might as well forget even going. I've seen people starting the teardown process at 9:30.

Looking at getting to a Hamfest at say 6:30 a.m., there is a "circle of opportunity" where a person decides just how early they are willing to

get up and travel. The closest decent sized Hamfests to here are
Timonium MD and Breezeshooters in Butler. Timonium is around 3 hours,
and Butler is a little over 2. So if I go to Timonium, I look forward to
getting up at 3 in the morning. Add an hour of sleep for Butler. THe
first couple years I was licensed, I would get up at that time - or more
likely just not go to sleep Saturday night.But I think hard about it now.
Those early start and end times severely limit the geography limits of
attendance.

> On the other hand, I'm not sure that there's anything specific to be

> logical and realistic reactions.

Respectully, I'm not really sure that another opinion on this subject is
being unrealistic though.

We have been doing a 2 percent increase in the local ham population (not
counting that recent surge) when newcomers/attrition is factored in.
Club membership is up over 10 percent. (2006-07 stats)

I know that a lot of Hams are pessimistic about the future. We even have
a few club members who figure that the service will die out in a few
years, and have all kinds of reasons for that. A number of us decided
that we were going to prove them wrong, and at least for the moment we
are doing just that. We instituted a no wheedling and whining policy, a
welcoming attitude toward the new guys and gals, gentle encouragement to
upgrade, lots of social events - every other Saturday breakfasts,
Wednesday evening very informal dinners, every other Saturday club shack
get togethers, 4 big socials during the year. Contesting, trips to Ham
radio stores. Only problem is some of the XYL's are starting to complain
that their OM's need to spend a bit of time at home too. And we're all
having a blast.

Steve Bonine <s...@pobox.com> posted on Thu, 6 Dec 2007 10:17:51 EST:

>I appreciate the kind words, Len, but I think that we all need to
>realize that the ham radio hobby as we know it is changing. Of course,

>that's no different than at any time in the past, since ham radio today is different in many respects than ham radio of previous generations. Like any other technology-driven activity, things have changed and will continue to change. Can you imagine how amazed someone from the spark-gap era would be if they were transported into today's world with its tiny multi-function DC-to-light transceivers? [And just as if to underscore how common that technology has become, when I misspelled "transceiver", my email client underlined it for me, and provided the correct spelling.]

Well, the comparison isn't limited to going all the way back to the spark-gap transmitter era of the 1920s. Just compare it to the amateur radio equipment of 1957. Only the adaptations of commercial radio done for the amateur radio market could accurately read to within (maybe) a hundred cycles (think Collins Radio as the best example then). SSB AM hadn't yet reached mainstream on HF and on-off keying CW of chains of vacuum tubes were the order of the day. RTTY was rare and packet unheard of, even the word 'data' hadn't become a generic to embrace all the various 'digital' modes. In fact, 'digital' was itself hardly used, limited to nerd-geek programmers of mainframe computers. :-)

Personal computers just didn't exist as common items of communications before 1970, just 37 years ago. The Bulletin Board Systems weren't there except in planning by a very few in 1975, just 32 years ago. BBSs were the precursor to the Internet and they flourished in the decade of approximately 1982 to 1992, became widely popular among personal computer hobbyists and devotees. The Internet became public in 1991, just 16 years ago, and that changed the fabric of society in the USA considerably more than personal radio (including amateur) had ever done. Solid-state devices had an enormous impact in almost all areas of electronics, including amateur radio. I see that as a very positive impact on advancement in all states of the electronics-radio art. A few still openly long for the old ways when things were 'simpler.'

Tagline: "When I was young we whittled our own ICs out of wood!" :-)

>There is, however, an aspect of change these days that is different than what the hobby has ever experienced, and it's related to the topic of this thread. The reality is that during the next decades the number of active ham radio operators is going to decrease. We can massage the numbers and wring our hands, but there are two absolute facts that we cannot change: (1) The ham population is aging, (2) The general population is less interested in ham radio than before.

Heh heh, pardon my chuckling...if I had said the same thing before 2007 (and I have) the reaction would have been severe on Usenet. :-)

>Perhaps some are unwilling to accept the second statement as a fact, but I think you're deluding yourself if so. Historically, most recruits into the hobby came from young folks, and this demographic is simply not

>as fascinated by radio as in the past -- they have many alternatives
>vying for their spare time. We are getting more middle-aged and retiree
>recruits than ever before, but even this population has many potential
>ways to spend their spare time and ham radio has to compete.

I have to admit that my case is a rarity and don't put myself up as
any example to emulate. :-)   I was already retired 9 years (at least
from regular hours) when I became an alleged 'beginner' in radio with
an amateur radio license. :-)   [that was done on approximately the
51st anniversary of getting my first FCC license...which was done 4
years after I had entered military communications...:-)]

>But the big item is the current age of the ham radio population and the
>fact that the same forces that are competing for spare time in the
>general population apply to already-licensed hams. Analysis of number
>of hams licensed is valuable but it doesn't tell the whole story.

True enough, but such statistics are about the only thing available
and
are derived from public databases by the only agency that grants
amateur radio licenses in the USA.

>How many licensed hams have gone inactive?

Careful, Steve, you can start a whole new argument on using 'active'
or
'inactive.' In the legal sense of licensing 'active' is used to
describe if
a licensee is within their 10-year grant term and has not entered the
2-
year grace period. To ordinary folk, the word 'active' is commonly
used
for someone who is engaged in some activity currently with only minor
pauses to do other things currently. 'Inactive' to ordinary folk
would
mean a rather full stoppage of an activity.

>There's no way license numbers
>can tell us, but there are other statistics that do shed a little light
>on it. I'm thinking about things like the number of entries in
>contests, or the number of voters in ARRL elections. The problem with
>these statistics is that they measure only one very narrow segment of
>the hobby, but at least they're not falling off significantly. Yet.

One might look to the market for amateur radio goods as a 'minor'
indicator also...and that would be in the number of visible
advertisements in the few amateur radio interest publications. Those
were already diminishing in 1990, 17 years ago. The appearance of
intense interest is kept alive in QST as an example, but that is a
membership magazine and sounding board for the ARRL. The size
and quality of the only real independent competitor in monthlies is
CQ and it has shrunk in the last two decades. Popular
Communications is an independent but it also caters to other radio

interests, not just amateur radio.

>On the other hand, I'm not sure that there's anything specific to be
>done based on a belief that the number of active hams will decline. Our
>local club is considering going from monthly meetings to quarterly
>meetings; I don't think that's a good idea but it's the sort of thing

>reality of a shrinking active-ham population, we can come up with
>logical and realistic reactions.

My opinion is that I don't see any 'logical' or 'realistic' things to
come
out of these discussion forums. It's (to me) just a lot of personal
expression, a window into what different folk think. A lot of
commentary is based on what individuals want to see and such
want things to continue in ways they like personally. Their
'reactions' have, by lots of visible proof, been severely negative
to anyone proposing changes. :-) What I can see happening logically
and realistically is individuals (such as yourself) doing things on
an
active basis and looking ahead to a more realistic probable future
for the hobby. Trends have already begun and those show more
changes ahead.

Tagline: "Today is the tomorrow you worried about yesterday." :-)

Nope. I concede that my opinion is based on anecdotal information based on what *I* see. Maybe I'm doing something wrong, or not doing something right, but I'm sure not seeing the same influx that you are, here in my area.

That's good, and I wish I could emulate your methods and get your results. But I think that the key words in the above paragraph are "a number of us". Maybe I can find some enthusiasm in the local area, but so far I've had little luck doing so. Perhaps the difference is urban area versus rural area.

Many yeards ago I read an article which stated that back in World War
One days President Wilson convened an advisory council composed of a
number of prominent Americans from different fields. Edison was a
member. Somebody suggested that Einstein would make a good addition to
the group. Edison's comment was something like "Somebody like Einstein
might be handy to have around in case somethimg needs to be figured
out."

Late flash - I found some other Ubuntu repository, and theere are a lot of Ham Radio Apps there. I've installed a few, and so far so good.

IMHO the circle game is complete.

I recall an article in QST (March 1964) where, by using
the right key sequences, a 60 wpm RTTY machine
could be made to send Morse Code. This was
particularly useful because in those days amateurs
using RTTY had to ID in Morse Code.

A few years later came the first CW keyboards,
which permitted someone with no Morse Code
sending skills to generate near-perfect Morse Code.

Now we have a rig that will permit a person with
no typing skills to send perfect RTTY or PSK31.

BWAAHAAHAAA - good one!

--

Another neat RTTY trick involved paper tape.

By using certain sequences of letters, the holes in
the paper tape could be made to form letters and numbers.
What was printed on the page looked like gibberish-with-a-pattern
but if you looked at the tape the message was clear.

Of course since it took several characters to make one letter, the
effective speed on a 60 wpm machine was about 15-20 wpm. And
there was no going back if you made a mistake. But the effect could
be impressive to the uninitiated.

I remember back-spacing and nulling out the mistake, then continuing.
But I wasn't 10 years old, either.

>Another neat RTTY trick involved paper tape.

"Trick?" TTY p-tape was standard practice among the big guns in communications of the 1940s. Back then it was 60 WPM on a 24/7 basis...just keep them fed with paper, ink, and once in a while, some lubricant. Teletype Corporation made a fine piece of goods.

>Of course since it took several characters to make one letter, the

TTY p-tape makes it possible to do an immediate re-send of the SAME message if a wire or radio circuit is blitzed by something. During WWII and afterwards it was the standard way at big hubs of networks that spread around the globe...be they military or commercial, the 'torn tape relay' rooms were big and efficient.

>...remembering the smell of hot machine oil in the W3ABT room...

I can easily remember an entire second floor at ADA's control center tape relay room of the early 1950s. Over 200 teleprinter machines busy working away 24/7. Impressive all by itself. And that was only the third-largest hub (RUAP) in the Army network then.

Nowadays if you ask about that, someone will suspect you of being a saboteur (don't want to use the "T" word).

A sad reflection on our times.

I must agree. My new laptop is no slouch, but at times I felt that I was operating with a 286 machine under Vista. My average time from boot to actually doing something was as much as 30 minutes, as all the programs accessed the web, looking for updates, and many of them crashed. At least

half the time, I have to hard kill the machine to turn it off. This is the fifth laptop I've tried with Vista. None have actually worked.

During Field day this year, we had tried to use N3FJP's software for networked logging with Vista. It failed most spectacularly (Vista failed, the logging software itself works wonderfully on XP machines. Apparently Vista occasionally "loses" an IP address, and the cure is to reboot. Not a very good situation in the middle of a multi station logging effort.

My laptop has performed flawlessly since the OS change.

The Ubuntu repositories have a lot of apps, There are Ham specific ones, such as loggers, digital mode software (linux even has AMTOR/PACTOR transmitting software) there are antenna modeling programs, even a Smith chart program. Lots of developer apps too.

There are quite a few electronic apps, such as transmission line calculators, and a whole lot of other stuff that I am just finding out about. More Hams need to check it out - I think the whole Operating system is in line with "Ham Spirit".

> I would recommend trying the K desktop (distributed as "Kubuntu")

I'll probably give that a try

Like they say, "It's all good". I don't know anyone nearby that has a K@, but at Dayton next year I'm going to haunt the Elecraft booth.

Thanks. I was toying around, not too serious, looking for something a
little shorter, and found this one. I like it both for Morse and Voice.

And N5EE was taken already, hehe

Well I don't really care for Ubuntu myself, but I can see where folks would like it. Personally I dislike it because it goes to great lengths to isolate you from the Unix stuff, most notable is that you cannot log into the "root" account from the GUI. Of course that's not usually a good idea, but there are times when it just makes sense to be "root" on a box.

For the folks that don't want to care about the Unix stuff, Ubuntu does a good job of hiding a lot of that. It also has a "run from the CD" mode that's kind of nice. You can run it without installing anything and see what you think. If you don't like it, just take the CD out.

Where do you find the HAM stuff though? I've got a Ubuntu install that I play with and I'd like to see what's built for it.

Did you mean "K2" or "K3"? I have a K2 and at least one other
regular here does too. Great rigs. I've used the KX1 and K1 as well.

> but at Dayton next year I'm going to haunt the Elecraft booth.

You and a lot of others...

Elecraft has shipped a few dozen K3s so far. The first two production
runs sold out long ago, if you order now, expect
a few weeks' wait as they catch up on backlog. Some reviews
have started to appear on the 'net, and eventually there will be
QST and Sherwood measurements of the truly amazing numbers.

I worked a couple of stations using K3s in CW SS last weekend, so they
are on the air.

>From the descriptions, assembling a K3 is more like building a PC than
it is assembling a Heathkit. The boards and modules are all
preassembled; you simply put it together and configure it. Which is
not a trivial job!

And like a PC, you have a choice of which options to add to the basic
unit. Options can be added at initial build or later. This helps keep
the price down - if you don't need things like general coverage
receive or a second receiver, you don't have to pay for them.

I don't work for Elecraft and my only interest is as a stisfied
customer and builder.

Yup, one of the shortest possible US CW calls that's not a 1x1. It's
tied with AE5E. Compare with a call like KQ0JJJ....

Besides, "N3LI" has the same rhythm as "N2EY"...

The Fedora project just announced a "spin" of Fedora called "Fedora Electronic Lab". This is a live CD loaded up with electronics stuff. Fedora includes a set of LiveCD tools to encourage custom spins. So far no ham app spin, tho.

The problem with these Live CDs is that you still need to have a bit of Linux savvy if you want to use the Live CD and save some data. It isn't hard, but if you are using the Live CD to try out some Linux distro that can be a pretty big barrier to fully enjoying it.

One of my former staffers and still friends, Bob Weller, picked up the call N6NE about 20 years ago. Bob spent 9 years with the FCC, then went to the private sector as a broadcast engineering consultant, and this week returned to the FCC as the RadHaz specialist. AFAIK he's still a CW contester, hence the short call.

> Where do you find the HAM stuff though? I've got a Ubuntu install that I play with and I'd like to see what's built for it.

Under Symantec, you can open up some extra repositories. I think theere is one more standard Ubuntu repository, and a "universal" one. There are both finished apps and various engines for developers. There are a couple more repositories that have proprietary drives also.

When I started studying for the Advanced or maybe it was the Extra class exam I was somewhat intimidated by the section on imaginary numbers, J operator, etc.
I studied it in college to get my electronics degree but that was quite a while ago.
My first thought was I can just guess at these questions and if I miss them all I will still pass the test.
Then I decided to just memorize the (Radio Shack) study material, not the formulas or the math to solve the problem.
I passed first try.

Many times as an Official Observer or OO I have seen people operate LSB 1 Khz from the lower phone band edge. Even after I quoted the law to the (not on that freq) they would still argue that they were operating in the band !

Hi, I'm learning CW, and so far have not been able to tune in the Arrl practice frequencies. I have only a 10 meter wire antenna, and I'm wondering if there is anyone here from the southern New England area that knows CW that wouldn't mind some practice on the 10 meter tech sub-band. Fair warning, I'm not up to 5 wpm yet. :)
I am usually on the air around 7pm.

Jim

Jim,

Please tell us your callsign and grid square: at this point in the sunspot cycle, ten meters isn't going to get much further than a CB set.

There are also other options you can pursue:

1. Use a computer and download one of several Morse study programs. I found them indispensable for learing the code, especially since they allow you to make custom lists of the characters you're having trouble with.

2. If you have VHF gear, you can set up schedules with local hams to do MCW on simplex or even with a cooperative repeater.

3. If all else fails, you can build a modem adapter that will allow you to practice with a friend via telephone line.

HTH.

73, W1AC

Hi Bill, my call sign is kb1odg, and according to the Arrl web site (I
don't have a grid map at the moment), my grid square is FN41.
I've been using a program called "Just Learn Morse Code" and it has
helped with copying code, but now I'm looking for software that can
"receive" code sent by a key.

In my search I came across this link, Arrl has made mp3 practice
recordings.
http://www.arrl.org/w1aw/morse.html

I did another search for MCW and came across this link: a schematic
for building an MCW oscillator
http://www.geocities.com/SiliconValley/2775/mcwosc1.html

I have a 2 meter HT, but it is only FM. I have not yet heard any morse
code in FM, except for repeater call signs. Does anyone do morse code
in FM on 2 meters?

Jim

Some months ago, I happened across a web site which contained short audio clips of various interesting sources of RF interference (MP3 files or a similar format). I remember a furnace, an electric blanket, and common stuff like arcing power lines and ignition noise. I should have known to grab the files and keep them local.

I went looking for the site again so that I could use these files as examples in the class I'm teaching, and can't find the site. I suspect it's now gone. Did anyone snag any of these examples, or point me to a source?

Thanks. 73, Steve KB9X

The monitoring stations used to call that "shooting fish in a barrel" back in the days when they did spectrum cruising (proactive enforcement).

My suggestion is to forget 10M, FM and VHF and get yourself some sort of HF radio which can directly tunes the 80M W1AW code practice sessions which should really boom your neighborhood. They're out there for much less than the cost of another HT. This one is only a hundred bucks brand new:

http://www.mfjenterprises.com/products.php?prodid=MFJ-9380K.

And you could use it to run CW on 80 after you've become a General and if you haven't been there yet it'll also introduce you to the wonderful world of ham radio solder smoke. Another affordable route to HF gear is the vast used equipment market.

I can vouch for the effectiveness of the 80M W1AW code practice sessions which took me from zip to 25WPM and beyond "back when".

To what is that 10 meter wire antenna connected? If it's a regular old HF transceiver (typically 160m - 10m) then you can use that 10 meter wire antenna to receive on 80 meters... and you should be able to hear W1AW on it. ?

BTW, I'm glad you're wanting to learn CW!

Howard N7SO

>
> Jim

Jim we have sent morse code practice on our 2M repeater (or simplex) The repeater code practice was a net and sanctioned by the repeater club and scheduled. Or use an infrequently used simplex frequency.

You need a CPO (Code Practice Oscillator) just key up the HT and place the CPO speaker next to the HT mic. Use the CPO to generate code audio. This audio modulates the FM transmitter.

Or have a computer program that sends code (by list or keyboard) place HT mic near the computer speaker.

When transmitting on the air 2M, be sure to ID your call every 10 minutes and a short voice announcement of what you are doing. Works well. Don't use a repeater for code practice without permission from the repeater club, best use an infrequently used simplex frequency e.g. 147.555 MHz NOT 146.520 MHz the National Simplex Freq)

Since code requirement has been dropped from the exams, we have discontinued the code practice nets.

Re ARRL code practice -- problem here is they send at various speeds - so you have to wait for transmissions you can copy and practice. Why not just get a computer program. See URL:

http://ac6v.com/morseprograms.htm

Another problem is two newbies probably send pretty sloppy code- not the way to learn receiving.

Good luck with the code.

Do you mean like this?....

http://en.wikipedia.org/wiki/Other_alphabets_in_Morse_code#Cyrillic

The page lists several other languages, also.

I found it with Google: cyrillic telegraphy
Google & Wikipedia are your friends. :-)

Changes followed by "|".

Welcome to rec.radio.amateur.moderated! This is a moderated newsgroup for amateur radio operators and other people having an interest in the Amateur Radio Service, as defined by national regulations and international treaties. Following are the posting guidelines for this newsgroup.

This message includes the following sections:

1. Topics and posting policies from the rec.radio.amateur.moderated Charter
2. Additional posting guidelines
    2.1 Netiquette guidelines
    2.2 Posting form requirements
    2.3 Guidelines on signature (.sig) files
    2.4 Guidelines on excessive quoting
    2.5 Guidelines on pointers to outside sources
    2.6 Guidelines regarding questioning someone's suitability to hold an amateur radio license
    2.7 Guidelines regarding name-calling
    2.8 Guidelines regarding civility
    2.9 Other unacceptable topics

---

1. Topics and posting policies from the rec.radio.amateur.moderated Charter

rec.radio.amateur.moderated is an inclusive on-line community of amateur radio operators and other people having an interest in the Amateur Radio Service. Participants are invited to engage in open discussion of amateur radio issues and exchange information about participating in the hobby/service, in an atmosphere of civility, friendship, and fun.

Acceptable topics include but, are not necessarily limited to, questions and discussions about amateur radio licensing, regulations, tips on various aspects of setting up an amateur radio station, and sharing operating experiences and insights.

Unacceptable posts include, but are not limited to, buy/sell/trade posts, posts that are off-topic to the Amateur Radio Service, posts promoting or defending unlawful activities, etc. Crossposts of regular discussion articles between rec.radio.amateur.moderated and other discussion newsgroups are not permitted.

Frequently-Asked-Questions lists and other information/bulletin/ announcement postings may be crossposted to rec.radio.info, rec.answers, and news.answers only with prior approval of the moderators of those newsgroups. In all such cases, an appropriate "Followup-To" header, containing only rec.radio.amateur.moderated, will be added by the moderators if one is not already provided.

Posters are encouraged to state their own views and share their experiences, but to refrain from making assumptions about the motivations of other newsgroup participants. Posters are expected to maintain a basic tone of civility. Prohibited uncivil discourse includes, but is not limited to, name calling.

Posts containing unsolicited advice questioning the right, worthiness, suitability and/or readiness of any individual (or members of any group) to be an amateur radio operator are unacceptable in this newsgroup. If an individual chooses to post asking for advice on when or whether to obtain an amateur radio license, or to participate in any type of lawful activity in the Amateur Radio Service, respondents should be careful to address their comments only to the original poster and not explicitly generalize to others in similar situations.

Similarly, posts that arbitrarily declare certain classes of amateur radio licenses, or certain members of national amateur radio societies (e.g., American Radio Relay League, Radio Amateurs of Canada, Radio Society of Great Britain, Wireless Institute of Australia, etc.), to be more or less worthy than others, are not permitted. Posts that politely encourage individuals to join their local amateur radio society, or to upgrade to higher classes of amateur radio license in order to enjoy greater operating privileges, are permitted, however. Posts that contain reasoned, civil, and fact-based discussion of the activities and internal politics of national amateur radio societies are also permitted.

Buy/Sell/Trade and Commercial Policy:

Posts containing offers to buy, sell, or trade are not permitted on rec.radio.amateur.moderated. The rec.radio.swap newsgroup was created for this purpose, and should be used instead. All such articles will be rejected by the moderators with the advice to re-post to that newsgroup.

Postings that are entirely commercial press releases, advertisements, or other public relations campaigns will not be permitted. Relatively unbiased announcements or reviews of new amateur radio-related products or services may be permitted at the discretion of the moderators. Such posters are asked to disclose their financial or professional interest, if any, in such products or services.

---

2. Additional Posting Guidelines

2.1 Netiquette guidelines

Participants who are new to Usenet should familiarize themselves with the "netiquette" of Usenet as well as the particular posting guidelines for this group. Several useful posts for "newbies" can be found on the newsgroup news.announce.newusers or on the WWW at:

http://www.faqs.org/faqs/by-newsgroup/news/news.announce.newusers.html

Particularly helpful articles are:

- Welcome to Usenet!
- Rules for posting to Usenet
- Hints on writing style for Usenet
- A Primer on How to Work With the Usenet Community
- Emily Postnews Answers Your Questions on Netiquette
- Answers to Frequently Asked Questions about Usenet

2.2 Posting form requirements

Any article that falls into any of the following categories will be automatically rejected:

A) Articles that contain original text of more than 75 characters per line
B) Crossposted articles to newsgroups not included in these Guidelines
C) Articles that contain more than 400 lines
D) Encoded binary files (except PGP and other short digital signatures)
E) Attachments to posts
F) Articles containing obscene language
G) Articles from individuals who have been suspended or banned from the newsgroup

2.3 Guidelines on signature (.sig) files

Many people close each article they write with a few lines of common text. This may be a cute quip or quote, or may include information about their family, contact information, or disclaimers required by their employer, for example.

Signature files used on rec.radio.amateur.moderated posting must be no longer than 8 lines.

The content of a poster's signature need not be relevant to amateur radio, but it must not violate any of the other posting guidelines. (For example, name-calling that would not be acceptable in the body of a message is also unacceptable in a signature.) Posters may include Uniform Resource Locators (URL's) and business addresses in signature files, provided they comply with all the other guidelines regarding signatures.

2.4 Guidelines on excessive quoting

Posts more than 20 lines long that also have more than 75% quoted text will be carefully reviewed by a moderator to determine if that degree of quoting is warranted. Posts with excessive quoted text may be rejected.

Posters must show a reasonable effort to trim the post they are replying to and to include just enough material to establish context. "Me too!" posts are discouraged, and, when posted, must edit the quoted material significantly.

2.5 Guidelines on pointers to outside sources

Unsolicited announcements and pointers to web sites that are strictly commercial press releases, advertisements, or other public relations campaigns, are not permitted. However, a pointer to a website or other external source of information is permitted and encouraged in cases where it is relevant to an existing thread, with appropriate context being given in the post. A URL with no information about what a user should expect to find there will be rejected. A pointer to information that is off-charter for rec.radio.amateur.moderated will be rejected, as will a pointer which itself does not meet the rec.radio.amateur.moderated guidelines (such as a URL containing embedded name-calling).

Moderators are not responsible for verifying the contents of any external information source.

2.6 Guidelines regarding questioning someone's suitability hold an amateur radio license

Identifiable groups and individuals may not be asked/told/etc. not to obtain an amateur radio license, or to only obtain certain classes of amateur radio license. It is not permissible to make statements that a person or members of a specific group "should" not, or should not be allowed to, become an amateur radio operator.

Solicited advice of this type is permissible; however, posters must be careful not to explicitly generalize to others who are in some way "like" the poster asking the question. Stick to the individual asking for advice.

It is acceptable to discuss verified violations, documented in criminal convictions or other government enforcement actions, by a person or members of a specific group.

2.7 Guidelines regarding name-calling

Nastiness addressed at a person is considered name-calling. Criticizing a person's *actions* is not, provided that it is done in a civil manner.

Attacks on an action which by their very nature include an accusation against the person's character are not acceptable. For example, "That's a lie" implies an intentional prevarication, and is considered name-calling. Acceptable ways of questioning the truth of a poster's statement include the more tactful "I don't think that's true," "I believe you are mistaken because..." or even simply "That's not true." "That's not true and you know it" crosses back over into name-calling, however.

2.8 Guidelines regarding civility

By charter, posters are expected to maintain a civil tone in all their postings. The guidelines on name-calling cover part of that requirement, but not all of it.

In general, posters are expected to consider the reputations of other participants, and refrain from making unnecessary accusations or assumptions about the motivations of others. A good rule of thumb is to phrase your comments as your opinion -- "I think..." "It seems to me that..." "This makes me wonder whether..." etc...

Posters are expected to make factual claims, to debate topics openly and in good faith, and to accept honest criticism, all without provocation or prevarication. At least one professional organization, the Institute of Electrical and Electronics Engineers (IEEE), has recognized that such fair dealings are necessary components of ethical conduct, and has incorporated them into its Code of Ethics:

http://www.ieee.org/portal/pages/about/whatis/code.html

Though the Amateur Radio Service is not a professional endeavor, the moderators strongly feel that the IEEE Code of Ethics is also a worthwhile set of guiding principles for participants in the rec.radio.amateur.moderated newsgroup.

Posters are not required to support the American Radio Relay League (ARRL). However, they are expected to adhere to the spirit of the other parts of the ARRL's "Amateur's Code":

http://www.arrl.org/acode.html

2.9 Other unacceptable topics

Participants are reminded that the charter also prohibits posts promoting or defending unlawful operating practices.

Posts may discuss whether operating practices are unlawful, or engage in reasoned debate over why certain operating practices should or should not be unlawful. Posts may discuss enforcement actions, such as by the Federal Communications Commission in the United States or similar government agencies in other countries, and evidence gathered by parties such as Official Observers in support of complaints about unlawful operation.

Discussions of what practices constitute unlawful operation in the Amateur Radio Service should be limited to *factual* descriptions of the laws in various jurisdictions. Posters' *opinions* as to what practices they consider unlawful are not permitted. In particular, posters are cautioned not to extrapolate their country's laws and regulations to those in other parts of the world, as they may be quite different.

Posts that entirely concern themselves with other radio services or hobbies, such as Citizen's Band, General Mobile Radio Service/Family Radio Service, and Scanner or Shortwave Listening, are considered off-topic to the rec.radio.amateur.moderated newsgroup. Newsgroups such as rec.radio.cb, rec.radio.scanner, and/or rec.radio.shortwave may be more appropriate venues for such posts.

Posts that attempt to publicly criticize moderators or moderation |
decisions in the newsgroup itself are also not permitted, as stated in |
our original newsgroup charter. Please direct any such critical |
feedback to our administrative contact address at the bottom of this |
article, where it will be carefully considered by an appeals team of |
moderators. This team is distinct from the initial team of moderators |
that approves or disapproves article submissions, and thus can provide |
independent oversight of moderation decisions. |

Similarly, if you see an obviously inappropriate article in our |
newsgroup, please assume that it was a mistake or a direct forgery. The |
moderation team makes every effort to protect the newsgroup from such |
incidents, but they do happen, albeit rarely. You may also submit |
feedback to the same address regarding such articles in our newsgroup, |
but it is likely that our monitoring software and procedures have |
already detected it, and we are actively handling the problem. Please |
resist "piling on" with followups to the newsgroup when these incidents |
occur, so that we don't have to reject such articles. |

Please direct any comments, questions, or criticisms about this article to rec-radio-amateur-moderated-request@panix.com.

(Adapted, with permission, from the misc.kids.moderated Posting Guidelines.)

> So are they just discharged? Can you recharge them?

> Or are they destroyed? Were the radios affected?

Just discharged. The radios are OK.

I have never noticed any names on the "x-ray" equipment. I should imagine thats the sort of detail they will keep to themselves. Giving the specs away would make it easier for the "bad guys" to figure out how to beat the scan.

Those of you with high-end antenna systems: are you hearing DX from stateside? Are you working DX from stateside? On what freqs. and what UTC times? I know the current solar cycle is at almost rock-bottom but wonder if having high-end antennas make a difference as I read an article in QST by the Force 12 CEO that it did help when he connected an unused antenna at TWR in Bonaire to their HF rigs. He said it was like turning a light on in a dark room. The bands came "alive." If propagation is at an all-time low right now, how is that possible?

jdp

Too often! I don't really think it is correct either. I look around my shack and garage and most of my stuff is homebrew. My entire hobby is more about making things than it is operating. I haven't built my own Xceiver yet tho'.

Looks like it should be a really nice unit with good performance. Good for him, and I'm going to follow this one!

Same here! And what isn't homebrew was usually assembled from a kit, converted from surplus or restored from 'basket case' condition.

Google my call to see the shack...

> My entire hobby is more
> about making things than it is operating.

I do both, though I lean more to operating.

>I haven't built my own > Xceiver
> yet tho'.

I've built three from scratch and restored/assembled several others.

Top drawer! Definitely not a project for a beginner but it shows what can be done.

It will be interesting to see if full schematics, and PCB layouts are available, and if certain parts can be obtained (like crystal filters).

As I opined in my 'invisible' posting: It looks like a very nice pre-
production prototype. Production versions would be about $3K each
or so.

In addition: Cornell Drentea has an interesting AOL home page. Over
35 years as a pro in the RF business. One should be able to believe
his specifications.

Some more observations....

The designer/builder/author is KW7CD, whose website has lots of interesting stuff. 50 years a ham, author of many books and articles, holder of several patents, and much more.

The rig looks like really good homebrew craftsmanship. Would love to see inside - hope that's in a future issue.

One thing I found interesting was the rated power consumption. when AC powered. 200 VA receive, 800 VA on full-power transmit! Possibly a switching supply with low power factor?

The logical comparison to make is with the Elecraft K3. A K3/100 with general coverage receive, TCXO and four optional filters is less than $2450 (without power supply). I'll leave it to others to compare numbers and features.

It's *easier* to work DX with high-end antennas, but it's *possible* without them. I've been away from my station for a week, but worked about a dozen DX stations on 20m CW while I was gone, working from the mobile.

I also frequently work DX on 40m CW and have worked some on SSB on both bands. (in both cases from the mobile)

I would say 40 and 20 are your best bets. 40 during hours of darkness - roughly until midnight being your best bet. (because sunrise in Europe is a bit after that and while you'll still have propagation, most of the DX stations available to work won't) 20 is best in the morning (from sunrise to about 10am or so) and in the evening. (say, 4pm-sunset)

But don't write off 15 or 10 meters. They *do* open, even now. Try especially during DX contests. There's an all-band contest on CW next weekend, and the ARRL 10-Meter Contest (both phone and CW) in December.

And, of course, the WARC bands. 12 may be rather spotty (but not completely dead). 17 is open most days. 30 is open *every* day though sometimes only domestically.

Try non-voice modes. Used to be CW was by far your best bet for DXing with limited antennas. CW still works a LOT better than phone when you don't have the biggest signal in the world. PSK31 has become VERY popular and it's quite easy to work DX on that mode - nearly as easy as on CW and sometimes with even less power.

Wow, an accomplished fellow for sure. On his home page I can see one big difference between him and me. He apparently could put the stuff he tore apart back together at the age of six. It took me until around 15 to do that. I was grounded a lot as a kid until my grandfather started shipping old radios that I was supposed to take apart. ;^)

Well a lot more than one big difference......

I repaired my first radio at the age of 9. It was a desktop Philco with Standard Broadcast :-) and Short Wave. I used it all thru my youth to listen to the likes of "The Lone Ranger", "The Shadow", "Your's Truly, Johnny Dollar" and "Big John and Sparky". I just collected it from my parents house. You know what, that same component has gone bad. You just can't get quality, I guess. That electrolytic only lasted 48 years. Wonder where I can find another one so I can fix it again. :-)

Mike, that lab bench shot looked perfectly normal to me. It's
obviously in the breadboard stage then and that's been the way its
been in the industry for over 40 years and on thousands of ham
benches, too! :-)

Look to me that Cornell was just being honest about it all. :-)

IMHO, having read Mr. Drentea's CV, I would not characterize him as an amateur.

Mike, that lab bench shot looked perfectly normal to me. It's
obviously in the breadboard stage then and that's been the way its
been in the industry for over 40 years and on thousands of ham
benches, too! :-)

Look to me that Cornell was just being honest about it all. :-)

Being honest about the procees any process is ajrdy the noram in the ARS

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group every month. You are now reading the first article, which explains what rec.radio.info is, and answers some Frequently Asked Questions. The second article is titled Posting Guidelines, and you only need to read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next " -- " string. The sections available are:

- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit chat about radio. Rec.radio.info will contain informational, factual articles only. Follow-ups are redirected to an appropriate other group, and further discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate

articles, it was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propagated across the net). This tag also facilitates a pre-existing method of dropping or canceling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

```
/Newsgroups:.*[ ,]rec\.radio\.info/h:j
```

either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

```
rec.radio.info:!s/:^
```

in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

```
sequence
rec.radio.info
rec.radio.
```

at the end of ~/.nn/init in order to see all the rec.radio.info

bulletins first, then read the remaining rec.radio.* without the bulletins.

More information about kill files may be obtained from Dave Fawthrop's Killfile FAQ at:

http://www.hyphenologist.co.uk/killfile/

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, we will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for discussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is the rec.radio.amateur.moderated Moderation Team. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@panix.com

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

rec-radio-info-request@panix.com

But before you do so, please be sure to check out the "Posting Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. We receive information in our mailbox; we then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

   rec.radio.swap may be more deserving of the posting in any matter.

   Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, We would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. We reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all we can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

Google has an excellent web interface to Usenet newsgroups. It is available at:

http://groups.google.com

It supports both reading and posting.

Another excellent web interface to at least the radio-related Usenet |
newsgroups is the RadioBanter site: |

http://www.radiobanter.com |

sponsored by the NewsgroupBanter project: |

http://www.newsgroupbanter.com |

It, too, supports both reading and posting. |

 -- Will the material appearing in rec.radio.info be archived somewhere? |

Yes. See Google Groups and RadioBanter above. |

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

 -- I have a regular posting with timely information, is there a way to
    speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires co-operation and goodwill to be beneficial to the community in the rec.radio hierarchy.

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

*** rec.radio.info - Posting Guidelines and Etiquette ***

Two introductory articles about rec.radio.info are posted to this group and to rec.answers/news.answers every month. You are now reading the second article, which explains how to submit something to rec.radio.info, and which answers some Frequently Asked Questions about the submission process. The first article is titled "Welcome to rec.radio.info", and it might be a good idea to check it out as well.

-- How do I submit something to rec.radio.info?

Two possibilities. You can use your newsreading software to just post the article to rec.radio.info, as you would do with any other newsgroup. The difference is that the software recognizes the special status of rec.radio.info as a moderated group, and will e-mail your article to us, the moderation team, instead of posting it to the group.

Alternatively, you can mail your article directly to us at the following address:

rec-radio-info@panix.com

Mailing us directly is probably (a wee bit) faster, but using the transparency offered by the newsreading software is probably more convenient.

If you have any questions, or wish to deal with some administrivia with the moderation team, we suggest mailing to the following address:

rec-radio-info-request@panix.com

-- How soon will I see my article appear?

It depends on how busy we are. Your article reaches us as mail, we have to read it first, give it the stamp of approval, and finally send it on to the group. We will attempt to read and decide on all submissions within 72 hours at the very least, though we will probably be able to process submissions much faster in actual practice.

The site from which we moderate this newsgroup, "Public Access Internet and Unix, NYC" (Panix), is directly connected to the Internet, and articles posted at that site should appear at most major news sites, including Google Groups, the same day. The principal delay, therefore, will be the wait in the moderator's submission queue.

If you post a periodic article, and have shown to be trustworthy, we may allow you to post directly if the article is of a timely nature. See the section below on direct posting.

-- Should my article be in a specific format?

No. If it is not totally illegible, we will accept it, and if it does not have a correct subject-line we will correct it with your permission -- that's what a moderator is for.

However.

You could do us a big favor by making sure your article conforms to these simple requirements:

1) The article must present information, not discussion or requests, We will reject the article or require you to change the wording if it is worth it.
2) A good, descriptive Subject line.
3) Always mention what source you got the information from.
4) Don't forget to include a Followup-To header, at least if you don't want further discussion to automatically be forwarded to you, the poster, which is the default if the article is only posted to rec.radio.info.

As we said: if your article is appropriate we will post it even if you don't follow these guidelines, but then don't blame us for not processing it immediately. 'Perfect' articles we can send on with a couple of keystrokes. Stuff that needs minor editing is going to have

to wait until we have time to do so.

Please do not waste both our and your time by posting requests, as this is an information only news group.

-- What about crossposting?

If you send something to rec.radio.info, just name any group you'd like to cross-post to in the Newsgroups field. Then, when we approve the article for rec.radio.info it will get automatically cross-posted to any other groups mentioned. This will also override the default Followup-To: poster, replacing it with the groups you cross posted to.

We would prefer if the group be cross-posted to the various discussion groups in the rec.radio.* hierarchy that are appropriate:

rec.radio.amateur.misc	Amateur (ham) radio and related matters
rec.radio.amateur.packet	Amateur Packet Radio discussions
rec.radio.amateur.policy	Amateur Radio practices, rules, etc.
rec.radio.noncomm	Non commercial radio discussions
rec.radio.shortwave	International broadcasting on the 'HF' bands
rec.radio.cb	Citizens Band (27 MHz) discussion
rec.radio.scanner	Scanner discussions (unsupported group)

or in one of the moderated groups:

rec.radio.amateur.moderated	Amateur radio practices, rules, etc.
rec.radio.broadcasting	Discussion of *domestic* radio broadcasting

We will leave it up to the poster to decide which group(s) are appropriate, but reserve the right to add groups if we feel it has broader interest. We will consult with the poster first.

Notes on crossposting:

- rec.radio.broadcasting is also a moderated group. The rec.radio.broadcasting moderator prefers to review all articles himself before posting. Placing rec.radio.broadcasting before rec.radio.info on the Newsgroups line should accomplish this. We will typically abide by the rec.radio.broadcasting moderator's decision whether the article is appropriate for rec.radio.info.

- rec.radio.amateur.moderated is also a moderated group. As the rec.radio.amateur.moderated Moderation Team manages both rec.radio.amateur.moderated and rec.radio.info, we can manage crossposting and approvals for both newsgroups. The rec.radio.amateur.moderated group does not allow crossposting to other discussion newsgroups, whether moderated or unmoderated. However, we would like to manage rec.radio.info as consistently as possible with how it was done by previous moderators, including the grandfathering of existing regular postings. Therefore, the submitter can choose rec.radio.amateur.moderated or the other unmoderated rec.radio.amateur.* discussion newsgroups for crossposting, but not

both.

- Any FAQ or informational posting approved by the rec.answers/news.answers moderation team that is also crossposted to any rec.radio.* newsgroup (besides just rec.radio.info) is also automatically pre-approved for rec.radio.info. See below for more information.

If you post to another moderated group, it may be better to make special arrangements with both moderators before posting by contacting us at our administrivia addresses.

In addition, cross-posts do not take up extra space; modern newsreaders can be configured to show you cross-posted articles only once anyway; not everybody reads rec.radio.info; and rec.radio.info was never meant to reduce the volume of the regular discussion newsgroups. But keep in mind that some of the mail gateways may filter out the informational postings (at request of the subscribers) to keep the load down.

You decide.

-- I have a regular posting with timely information, can I make arrangements to help speed up delivery by posting directly from my site?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires cooperation and good will to be beneficial to the community in the rec.radio.* hierarchy.

If you are currently maintaining (or plan to maintain) a radio-related periodic information posting, you may wish to consider crossposting it to rec.answers/news.answers. Postings that are approved by the rec.answers/news.answers moderators for this treatment are automatically pre-approved for crossposting to rec.radio.info (as the news.answers requirements are far more rigorous than the requirements this newsgroup ever plans to use). For more information about this option, consult the appropriate information articles and posting guidelines in rec.answers/news.answers.

Realize also, that even if your post is not approved for rec.answers/news.answers, it can still be approved for rec.radio.info. The intention is not so much to get every last bit of radio-related information on rec.answers/news.answers, but rather to provide an alternative avenue of approval (as well as grandfather existing maintainers of radio-related information and spare them additional

bureaucratic hurdles). Again, crossposting to either rec.radio.info or rec.answers/news.answers, both, or neither, is at the discretion of the poster (subject to the approval of the moderators). You decide what is most appropriate for your article.

Please remember that as an information maintainer, you are not alone. There are many others on the net who maintain and post periodic information postings, using various intermediate-to-advanced features of Usenet (usually via automated tools). Various degrees of technical support and general hand-holding are available from many Usenet veterans. Send us some E-mail describing your needs to our administrative address below, and we'll try to help, or at least refer you to the right knowledgeable individual(s).

-- And Follow-ups?

If the only newsgroup you have specified is rec.radio.info, then the Followup-To: field will always be set to poster. If you do not want this, you must supply a Followup-To line of your own, and we will honor that one, as long as it is a subset of the original Newsgroups line.

If you specify newsgroups to cross-post to, then the Followup-To field will be set to include all the cross-posted groups, excepting rec.radio.info itself. Again, if you do not wish this behavior, supply your own Followup-To line.

We maintain other standards on the various RFC-1036 (news transport) header lines. For example, if the article is appropriate for passing into the Packet Radio Information Network, we encapsulate the Packet Bulletin Identifier (BID) in the Message-ID: news header line indicating the machine of origin as the ampr.org domain:

```
 Message-ID: <$opa.55.1994@ampr.org>                                      |
```

where the Packet Radio BID, in this example, is `$OPA.55', and it was posted in the year 1994, because some of the Bid numbers are cycled yearly. Hopefully, this can be used as a key to re-introduce the articles for the Packet Radio network. Also, if the article is a repost of an already existing information article in the rec.radio heirarchy, we ensure that the References: header line is linked to that previously posted article. This also helps to tag articles, and may be used for additional filtering if needed.

Since the articles are archived, please use the Summary and Keywords header lines to help one search for your article.

-- Why have I received no reply from you?

We never reject anything in silence, and we make a point of it to answer all our mail. However, E-mail, like a brain cell, can and does get lost, every now and again.

So, if you send us something, and you don't see it appear it

rec.radio.info, and you still have not heard from us in reply after say, five days, you can be pretty sure that either your mail never reached us, or that our answer has never reached you. In that case, please try again (We will filter out duplicates).

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

(Adapted, with permission, from the original article written by Mark Salyzyn, AG4YD, ex-VE6MGS.)

Hi Folks

I discovered PSK31 just before the sunspots faded out. I bought an interface and worked QRP on 14.070MHz. Had a really good time too, its a fantastic mode, especially for QRP and those who cant fit yagis into the homestead (like me).

But a quick question to those more familiar with data modes.

If I connect the interface to my desktop computer, it receives well, but I cant get clear transmit. It sends full scale white noise no matter how I adjust the mic gain or audio levels. If I connect up the laptop, same TX noise problem .... until I unplug the mains charger and run on batteries. Then its perfect.

My laptop batteries last about 2 hours there days, so I'm limited to 2 hour long operation until I sort the problem or get a higher capacity battery.

Any thoughts what's causing it?

cheers
Jack VK2CJC / MM0AXL

Jack,

The first thing to check is that the interface is FULLY isolated. Surprisingly, some commercial interfaces use isolation transformers on only the RX line. Also, not all use fully isolated keying. Check the manual, or disconnect all the computer inputs to the interface, and then check with a meter between the interface case and the rig. Should NOT read a DC short. (Or probably with the laptop connected without the mains, check between a metal point on the laptop and the rig. Haven't tried this, but it should work the same.)

If you find a DC ground, it can be easily fixed with an inexpensive 600 ohm audio transformer. The PTT is a little harder, but not much.

I am just starting to get my feet wet in homebrewing, etc., and need to consider getting a scope. I see a chinese product on ebay, "DSO 2150 USB Oscilloscope" which seems to have adequate specs for un challenging measurement requirements.

I was wondering if anyone on this reflector has had any experience with this product?

I should imagine that this facility would be easily added as a feature. But they never will. When I moved from the UK to Australia, I took my region 1 HF radios to region 3. I contacted Kenwood and Icom to find out if I could reprogram the band edges to allow use of the larger 40m band. Both were very helpful and told me how to "wide band" them, which fixed the problem.

I found out that the radios were available in 3 versions. One for each region. And it was not possible to make one version into another without replacing ICs at the factory.

If "mode sensitive" sub bands were programmed, every time someone moved, or a change in bandplan was brought in, it would be nessesary to go to the Yaecomwood dealership and ask to have the radio changed. An expensive, time consuming and unnecessary exercise :o)

Besides. I wouldn't buy a radio that was restrictively programmed in a manner I wasn't able to undo. Just for the principle of it.

This will cause a problem for those who use AFSK for RTTY rather than FSK.

The radio has to be set for "SSB" to use AFSK. The effect on the receiving end is identical to using FSK and so is a perfectly legal way to do RTTY.. If you put this as a "hard point" in the radio, you eliminate using AFSK for RTTY. Something along the lines of the "law of unintended consequences".

You can program many new rigs to auto mode switch based on frequency but
they also allow you override that auto mode at any time.

I picked six two-hour sessions as a compromise between having enough time to cover everything I want to cover and being able to attract enough people to conduct a class. I'll trade off time covering concepts to time covering specific pool questions since I owe it to the students to cover both. And I'm sure I'll be challenged to keep it simple enough for some students while trying to challenge the rest.
>
> 73, Steve KB9X
>

I never got a class for my novice license thirty years ago. I listened to a lot of code on a shortwave radio in the parlor of a church's community building and practically memorized an ARRL publication entitled "How to Become a Radio Amateur" if I'm remembering correctly. And even though I'm an electrician by craft let me assure you that there is not a lot of theory to electrical service work. The only time I've needed ohms law is for long outdoor feeders but I was ahead of the other apprentices when I learned about feeders because of amateur radio. I let my novice license lapse because I moved to an apartment and could not have antennas there.

So back in January my Fire Chief calls me aside and says since you've been training the Community Emergency Response Team volunteers and studied up on disaster preparedness I want you to represent the department on the cities Disaster Preparedness Committee. My work on the committee showed me that the local government could not afford a lot by way of communications for disaster response work. The only likely source of help we could identify was amateur radio.

I new there had been a lot of changes in the thirty years gone by so I took the technician class given over two weekends in February of this year. One of the things that the instructors showed us was some home brew antennas. After passing my exam I tackled a collinear J-Pole as my first home brew antenna because I could afford the tubing a lot easier than I could afford any of the ready made antennas that claimed a similar gain. I bought a used SWR meter, a club member checked it

against an antenna analyzer into a club antenna, and using only that SWR
meter and some patience I adjusted the J-pole to an acceptable SWR. A
used Yaesu FT470, Mirage BD35, and that J-pole, and I'm working a fair
number of repeaters, participating in the local EMCOM training net and
working every public service gig I can. I can't build a radio yet, but
I have been praised for my work on the events by people who have no
reason to butter me up. I got to try out HF at the Get On The Air table
of the clubs field day in June and the list goes on. I think I'm
getting an awful lot of mileage out of that two weekends.

I know I'm rambling but don't sell your students short. If you put the
effort into preparing a lot of show and tell, using real world examples
they may surprise you with how much they learn. Some of what they learn
you may never be aware of but the stuff I learned out of ARRL books is
still helping me feed my family. The material they put in the effort to
present during those two weekends back in February is helping me to
learn to help my community if the stuff ever does hit the fan.

Today's ham equipment has plenty of computing capacity to be able to handle band edges, sub-bands, and band plans. These rigs can be connected to a PC and programmed using software specific to the equipment. For example, it's common to program local repeaters (and not-so-local repeaters) into the memory of VHF/UHF rigs using the software on the owner's PC then downloading the information into the rig.

It would be an easy programming effort to do the same kind of thing for

HF. Let the owner pick a starting place, perhaps by ITU region, and modify it based on license class and/or personal preference. Essentially I'm asking for the capability to program the details of band plans into the rig and to easily change this information as desired.

> Besides. I wouldn't buy a radio that was restrictively programmed in a
> manner I wasn't able to undo. Just for the principle of it.

No, neither would I (except that I've bought rigs that won't transmit outside of amateur allocations, presumably something that I could undo given proper motivation). But that's not at all what I am suggesting.

For those of you who are upset with me as an "appliance operator", I don't see anything wrong with using available technology to keep me from doing something stupid.

I picked six two-hour sessions as a compromise between having enough time to cover everything I want to cover and being able to attract enough people to conduct a class. I'll trade off time covering concepts to time covering specific pool questions since I owe it to the students to cover both. And I'm sure I'll be challenged to keep it simple enough for some students while trying to challenge the rest.
>
> 73, Steve KB9X
>

I never got a class for my novice license thirty years ago. I listened to a lot of code on a shortwave radio in the parlor of a church's community building and practically memorized an ARRL publication entitled "How to Become a Radio Amateur" if I'm remembering correctly. And even though I'm an electrician by craft let me assure you that there is not a lot of theory to electrical service work. The only time I've needed ohms law is for long outdoor feeders but I was ahead of the other apprentices when I learned about feeders because of amateur radio. I let my novice license lapse because I moved to an apartment and could not have antennas there.

So back in January my Fire Chief calls me aside and says since you've been training the Community Emergency Response Team volunteers and studied up on disaster preparedness I want you to represent the department on the cities Disaster Preparedness Committee. My work on the committee showed me that the local government could not afford a lot by way of communications for disaster response work. The only likely source of help we could identify was amateur radio.

I new there had been a lot of changes in the thirty years gone by so I took the technician class given over two weekends in February of this year. One of the things that the instructors showed us was some home brew antennas. After passing my exam I tackled a collinear J-Pole as my first home brew antenna because I could afford the tubing a lot easier than I could afford any of the ready made antennas that claimed a similar gain. I bought a used SWR meter, a club member checked it against an antenna analyzer into a club antenna, and using only that SWR meter and some patience I adjusted the J-pole to an acceptable SWR. A used Yaesu FT470, Mirage BD35, and that J-pole, and I'm working a fair number of repeaters, participating in the local EMCOM training net and working every public service gig I can. I can't build a radio yet, but I have been praised for my work on the events by people who have no reason to butter me up. I got to try out HF at the Get On The Air table of the clubs field day in June and the list goes on. I think I'm getting an awful lot of mileage out of that two weekends.

I know I'm rambling but don't sell your students short. If you put the effort into preparing a lot of show and tell, using real world examples they may surprise you with how much they learn. Some of what they learn you may never be aware of but the stuff I learned out of ARRL books is still helping me feed my family. The material they put in the effort to present during those two weekends back in February is helping me to learn to help my community if the stuff ever does hit the fan.

Indeed, it is also a problem if you use the HF set as the driver for a transverter to a band where the bandplan is entirely different.

I don't know of any that do, in terms of subbands-by-mode or subbands-by-license-class.

But I don't think it would be a big feat of software engineering to have a lookup table that compared the mode selection with the transmit frequency, and allowed transmission only if the selection was in the lookup table.

> Certainly they *could* have that ability, since they already
> "know" the band edges and in most cases won't allow you to

> and not allow SSB in the CW band?

As N8UZE points out, this would limit flexibility, because all sorts of "soundcard data modes" are often implemented by putting the rig in SSB mode and feeding audio into it. This may become less of a problem as more rigs incorporate data modes internally. (The Elecraft K3 can send and receive RTTY and PSK31 without a computer, monitor, or keyboard).

> I don't think that most folks who find themselves doing something

With all due respect, if someone forgets the regs by being caught up
in the excitement, they really don't know them in a practical sense.

> I would like to see
> the flexibility in a piece of equipment that I just shelled out big

> different.

The second problem is that, for flexibility, you'd have to include the
ability to defeat/disable the feature. Which means it could be left in
the off position unintentionally, and provide no protection.

Your brain is available technology and has been around for a lot longer
than computers ;-)

Seriously, I know what you're saying and I sort of agree, but I wouldn't
want to see anything forced on us. If you feel you may "do something
stupid" without assistance, fine, for my part I prefer the flexibility of
using my equipment how I want to, not how a computer tells me I should.

I don't know how 'easy' it would be, but it could be done. The classic
'bell-the-cat' question is: who will do the actual work?

> Let the owner pick a starting place, perhaps by ITU region, and
> modify it based on license class and/or personal preference.
> Essentially I'm asking for the capability to program the details of
> band
> plans into the rig and to easily change this information as desired.

Or, the rigmakers could offer downloadable firmware options. When
the rules change, download an update. Some rigmakers, like TenTec and
Elecraft, do this already.

Another approach is that as SDRs become more popular, the feature
would be part of the user interface.

> > Besides. I wouldn't buy a radio that was restrictively
> > programmed in a
> > manner I wasn't able to undo. Just for the principle of it.
>
> No, neither would I (except that I've bought rigs that won't transmit
> outside of amateur allocations, presumably something that I could
> undo
> given proper motivation). But that's not at all what I am suggesting.

Ultimately you'd want the ability to defeat the feature, in case the
rig were sold or loaned to someone with a higher license class, or the
rules changed, or you traveled somewhere with different rules.

> For those of you who are upset with me as an "appliance
> operator", I
> don't see anything wrong with using available technology to keep > me from doing
something stupid.

I think it depends on the intent.

It's one thing to build in features that prevent problems. For example, the power supplies of my non-QRP homebrew rigs built since 1980 have built-in time delay protection so that the high voltage cannot be applied until the final amplifier and rectifier tubes have had 60 seconds to warm up, and the bias supply is operating. That protection is not essential to the operation of the rig, but it has probably saved me from a few problems along the way.

It's quite a different thing, IMHO, to build in features with the intent that the features remove the need for the licensed operator to know things, like the subband edges.

IOW, the feature is a backup, not primary protection.

Good trick. I can see using the front-panel display for the monitor
but how does one input alphanumeric characters without a keyboard of
sorts?

Then again, what do I know? I'm just as lowly K2 "appliance operator"

Another angle on the same challenge would be who would be motivated to
develop a vendor-independent standard, that would actually be widely
adopted by vendors, to implement this?  Witness the various permutations
of DC power connectors (with amateur radio emergency groups driven to
distraction trying to establish at least local standards).  Witness the
inability to develop working, vendor-independent, interoperable
standards for high-speed radio modems (9600 baud and above) that could
be found in commonly-available commercial amateur radio gear.  Amateur
radio equipment manufacturers appear to prefer to differentiate their
products by unique, and unfortunately incompatible, means of interfacing
and control, with few economic incentives to standardize with other
brands.

Will your amateur radio that is programmed to recognize band edges and
```

allowed modes be able to be modified via reasonably available tools and techniques for the indefinite future? Examples that may cause me to think otherwise include:

- Most amateur radio equipment in the past couple of decades, for economic reasons, tends to use custom bit-masked EEPROM's to implement their internal programming, something that would not be economical to duplicate by third-party manufacturers. Though amateur radio equipment would seem to be covered by the Magnuson Moss Act (i.e., availability of parts on the open market for some period of time after the end of manufacture, preservation of warranty even if third party parts and service are used, etc.), I also recall letters to QST complaining about repair depots simply being unable to fix amateur radio equipment, some of which was less than 10 years old.

- I recall a legal dust-up from some years ago, discussed on the newsgroups, where Motorola was cracking down on efforts to reverse-engineer radio interfaces and the software that is used to modify the configurations of their radios. Regardless of whether Motorola was taking a legally defensible position, if the software is proprietary, or unable to run on current computers, or otherwise unavailable or unusable in some way, you may be left holding the bag.

Consider the problem with VCR's and the recent change in the start of Daylight Savings Time in the U.S., and no way to modify them.

>Another approach is that as SDRs become more popular, the feature
>would be part of the user interface.

This would appear to offer more promise of future compatibility and programmability, though might still run afoul of legal problems with regard to reverse engineering or otherwise developing openly-published specifications and third-party software tools. Whether or not these positions would be legally defensible might not prevent manufacturers from attempting to chill the open market for these tools via intimidation tactics. Also, how long would it take for software-defined radios to propagate out to the amateur radio community in significant enough numbers to make a meaningful impact?

>73 de Jim, N2EY

I think that's the important distinction. It's also related to a classic conundrum in developing safety systems in other fields. I would welcome an amateur radio that had fault protection to keep me from blowing the finals if I accidentally transmitted into no load or an infinite load. I'm not so sure about an amateur radio that would keep me from transmitting out of band or in an unauthorized mode if assumptions about what constituted "out of band" or "authorized mode" changes, or if I find myself in a true, bona-fide, communications emergency.

The Usenet newsgroup comp.risks (aka, "Risks Digest") has touched on many of these types of issues. For example, while a rev-limiter on a motor would increase safety by preventing a blown engine, putting speed limiters on automobiles to keep them within speed limits may increase accidents by denying the necessary amount of power to get you out of a reasonably unanticipated emergency situation while passing or merging. An airplane whose controls would keep you from overstressing the airframe, or flying into restricted airspace, might also keep you from making appropriate emergency maneuvers, where landing alive with your crew and passengers, but with an airframe you have just end-of-lifed, or under fighter escort to be whisked off to a friendly interview with the authorities, might be far preferable to the alternatives.

The following is a Q-S-T. AMSAT announces plans for a geosynchronous ham radio satellite, W-R-C 2007 opens in Geneva, D-Star comes to Germany and France and ham radio operators stand down as the California wildfires are contained. Find out the details on Amateur Radio NewslineT report number 1577 coming your way right now.

**

HAM RADIO IN SPACE: AMSAT SAYS HAM RADIO GEOSAT IN PLANNING

Its called Phase 4 Lite and it will likely change the face of ham radio forever. Amateur Radio Newsline's Bruce Tennant, K6PZW, has a peek at the future of a geosynchronous ham radio satellite in Earth orbit:

--

The weekend of October 26th to the 28th has likely changed the face of ham radio space operations. So say two leaders in the Amateur Radio space program speaking at the AMSAT-North America Space Symposium in Pittsburgh, Pennsylvania. That's they announced that a first-ever geosynchronous ham radio satellite is now in its initial planning.

In satellite talk, geosynchronous means stationary in the sky. From the standpoint of a ground station user, it means always knowing where to point an antenna. No tracking and no guesswork.

At that gathering, AMSAT President Rick Hambly, W2GPS, and Vice-President of Engineering Bob McGwier,N4HY, announced that AMSAT has been in consultation with Intelsat. This, regarding an application of an Intelsat platform carrying amateur radio satellites into geosynchronous orbit.

The Phase IV Lite Geosynchronous Payload is planned to consist of similar transponders already under development for the Phase 3 satellites. Accelerated development on the digital Advanced Communication Package is anticipated. The Intelsat geosynchronous platform would be able to provide the AMSAT Phase IV Lite payload with approximately 400 watts of DC power for 15 years.

In addition to the on-orbit payload AMSAT plans to develop an earth station attainable by the average ham so that users can immediately take advantage of the audio, digital messaging, and video services of the Phase IV bird. The Advanced Communication Package would be a self-contained earth station which could be sent with amateur radio communication teams or delivered to disaster areas to provide for 24 hour a day, 7 day a week and 3565 days a year emergency communications. These teams would be able to point a small dish at a predictable spot in the sky and immediately begin delivering disaster communication support without depending on the vagaries of High Frequency propagation.

But that's not all. Hambly and Mc Gwier say that the Phase IV payload could also be used to provide a Tracking and Data Relay System Satellite -like relay of ARISS communications. The current 10 minute school contact could now be expanded to hours-long contact with the International Space Station. This opens possibilities for extended student involvement with experiments aboard the space station.

As the late Roy Neal, K6DUE, might have said: Truly a new world of Amateur Radio.

For the Amateur Radio Newsline I'm Bruce Tennant, K6PZW, in Los Angeles.

--

So when can we expect this new satellite to be on-orbit?, AMSAT says that engineering studies, funding studies, among other negotiations are continuing so no specific date can be set. However Bob McGuier N4HY observes that the project is far enough along that AMSAT needs to begin planning engineering work and possible construction of such a geosynchronous payload so it is ready if Intelsat says they have a ride for it.

Couple of other modes, too. See the website - the manual is online now:

www.elecraft.com

>
> Good trick. I can see using the front-panel display for the monitor

> keyboard of sorts?

You send Morse Code to the rig and it translates/encodes the Morse into the PSK31, RTTY, etc. Paddles are the usual input device.

Built in, not an add-on device. The decoder is reputedly very good
too, its only limitation being the limited display space.

Yet it is possible to get all four of those questions wrong and still
pass the test. The result is a licensed amateur with big 'holes' in
his/her knowledge of certain areas.

> > I don't envy the committee that formulated the pool.

The big question is whether the criticism is constructive, or just a
form of complaining. IOW, does the critic offer a way to make the
process better?

Who are these people, making such claims, Len?

It seems to me that one main purpose of license testing is to
insure that the licensee knows enough about the thing being
licensed for so that s/he can reasonably do what the license
allows. For an amateur license, that means knowing the basics
of amateur radio, in the form of technology, rules & regs, and
operating practices.

Most important is that the tests focus on what *amateurs* are
allowed to do on the air, and how they typically do it. Experience
and knowledge of other radio services may or may not be relevant.
A Ph.D. in EE with multiple patents is not necessarily qualified
to be a radio amateur if s/he doesn't know the amateur radio
regulations.

> Back when the FCC 'personally' tested radio operators, it was
> proclaimed a 'Real Test.' From expeience of many of my
> contemporaries, that 'reality' didn't exist.

>From my personal experience, and from that of many of *my*
contemporaries, that reality certainly did exist. Not that the tests
for an amateur or commercial radio license were equivalent to
what I later encountered in EE school, but they were real tests
of what the licensee knew with regards to amateur radio.

> There was no way
> one could 'test' for radio equipment of 1956 to make anyone
> 'expert.'

Agreed - but that wasn't the purpose. The tests were to see if
the licensee had met a certain minimum level of knowledge and
skill, not that the person was an expert.

Anyone knowledgeable about Morse Code will tell you that even
the old 1 minute solid copy 20 wpm Morse Code test wasn't
"expert" level.....;-)

> When the FCC revamped a lot of their work to include

The question-and-answer pools became public knowledge in two steps.

The first was the publication of the "Bash books" in the 1970s, whose information was gathered by means that, IMHO, clearly violated the law. But the top folks at FCC decided not to prosecute Dick Bash nor those who helped him, so the books made it possible for those willing to spend the money to see a pretty close replica of the actual exams.

The second step was the creation of the Question Pool Committee and the VEC system in the early 1980s. This replaced the work of paid Federal government employees with that of unpaid amateur volunteers.

> I cannot see where the Volunteer Examiner Coordinator
> system is so 'bad.'

I think the main criticism is not of the VEC system itself, but rather the fact that prospective licensees can see the exact questions and answers that will be on the test.

In the pre-Bash-book days, a prospective licensee did not have access to the exact Q&A. There were study guides which indicated the general areas of information that would be on the test, and in some cases the test followed the study guide closely, but that was not the same thing as seeing the exact questions and answers.

For example, the study guide showed some Ohm's Law problems in essay format. The actual test would show some Ohm's Law problems in multiple-choice format, but the prospective amateur did not know much else about the Ohm's Law problems on the test. The logical response in most cases was to learn enough Ohm's Law theory to be able to solve all sorts of problems in that subject.

With the actual test questions available, it becomes possible to "study the test" rather than actually learning the material. In another thread in this NG, there have been discussions about using a class to teach the test rather than an understanding of the material.

Which is better - learning and understanding the material, even at a basic level, or simply learning the test questions by rote memory, to be forgotten?

> It is composed of active fellow amateur

> considered dummies. That's better than having questions
> and answers thunk up by a faceless few at the FCC, ones
> whose primary task is radio regulation, not boosting amateur
> radio nor trying to get more licensees.

Again, the perceived problem is not the VEC system itself, but the fact of public Q&A.

Note too that the Question Pool Committee is, in practice, almost as much of a "faceless few" as the FCC was.

VECs do not make up the questions and answers directly. Nor do they make any decisions on the process other than selecting specific questions for each exam, to insure randomness. They only proctor the exams.

> All in all, I think the
> VEC QPC is doing a FINE job given their virtual free rein on
> what to ask in every test element.

I agree that within their limitations they are doing a good job. The problem is the limitations they have to work under. Those limitations are not of their doing.

There have also been a few *documented* instances of irregularities in the administration of exams by specific VEC groups. (See FCC Enforcement Letters).

> It is even better when one considers the first word in their
> description: Voluntary. Those on the Committee have
> guts as well as experience in volunteering for a sometimes

> five fingers, properly) for keeping up that task for two
> decades (give or take).

It's good to see you saluting and thanking them, Len. Particularly considering your criticism of certain VECs in the past. What changed your mind?

Volunteer examiners go back a lot longer than the 1980s.
They date back at least to the 1930s, when the Class C license
was created for those who lived too far from an FCC exam point, or who were disabled. Later (1954), all routine exams for Novice and Technician licenses, as well as the Conditional, were done by volunteer examiners.

My first amateur radio license exams were given by a volunteer examiner, K3NYT, when I was a little past my 13th birthday. I realize now that it took him some time and effort to make the exam sessions possible for me. That Novice license of 1967 opened up the world of amateur radio to me, and led to a career in electrical engineering.

And yes, I thanked him.

If the size of the pool were increased, would that satisfy your objection? Given a finite body of information, there are only so many questions that can be formulated from it to test an applicant's knowledge. I have a number of the old Ameco Q&A books from the days before question pools (for the commercial tests). If you compare the Ameco questions, that is, the questions that the author MADE UP, with the later FCC questions, you don't find a great deal of difference.

I have always found that a decently written test preparation guide, in Q&A format, for a test like a New York State Regents exam, an SAT, a GRE or a GMAT is just about as good as a published test pool, especially if the pool is large. That is particularly true when the questions tend to be similar from one year to the next (For example, one year, they ask you to solve for x when 3x=6. The next year, the question is changed to 4x=8. The test prep guide has a sample question of 5x=10.)

The national Multistate Bar Exam, one element of each state's bar exam, is composed of 200 multiple choice questions. Half of those come from the published "Green Book", a compilation of 500 Q&As, the equivalent of the Question Pool Study Guide. The other half are composed on the fly by a "faceless committee" for each semi-annual exam (all given on the same day nationwide). Thus, 20% of the Q&As on each test is from a published pool, while the remaining 80% of the Q&As require absolute knowledge of the published areas being tested.

The answer choices of each question usually consist of two that are obviously incorrect and two more that appear to be very close, and the process is really to identify the better of the two. A score of 130 = 65% or better is the minimum required in most states. In California, acknowledged to have the toughest test, a score of 152 = 76% is an absolute pass where performance on the other elements of the exam are not even taken into account.

Granted that the level of knowledge required for passing the Bar exam is greater than the level of knowledge required for passing an amateur exam, the key factor in both is not the size of the published pool, but should be the knowledge of the examinee.

As we were told in Bar Exam review courses, the correct answer is right there in front of you, and all you really have to know is "a", "b", "c" , or "d".

Correction - the exam questions from the published pool are 20% of
those published. The ratio of published to non-published questions is,
of course, 50%/50%.

Objection, your honor. Counsel's answer is non-responsive.

I asked if a larger question pool would be as good as non-published questions. You responded with a tale about a test that includes 100 questions that are drawn from a pool of 500 questions (5 to 1 ratio). We have already established that the amateur pool to question ratio is over 10 to 1. Would you consider an increase to, let's say, 20 to 1 to be an acceptable solution?

> not how a computer tells me I should.

Well put Ivor. I feel the same way.

My most recent 2m radio (Yaesu FT1802) has automatic repeater shift, which I have been forced to turn off as it tries to shift the TX on a few frequencies which due to local convention, I require to use simplex. Automatic features are great, especially if you can switch them off :o)

Heres a couple of questions for someone who knows about batteries.

I have two hand held radios which I rarely use. An Alinco dual bander with Nmhi batteries, and a commercial UHF with Nicad batteries. Both sets of batteries are in good order and hold a charge well. I can leave them for months and when I pick the radios up, they still have a good charge in them.

Today I lifted both radios, the first time in a month or two, and both had totally flat batteries. I know both were fully charged when I last switched them off. What happened? The weather has got warmer in the last month, and the humidity levels are up. But nothing else has changed. What flattened them both?

Also...

Last time I took a hand held radio abroad, I took 2 sets of batteries. Both were fully charged when they were packed. Both were flat when I reached my destination. Same with my mobile phone and camera batteries as well. All were nearly flat and had not been switched on during the journey. What is it that makes batteries go flat when travelling in a pressurised aircraft?

I hope someone can advise. I've been thinking about the aircraft one for ages :o)

Nothing in an airplane makes batteries go flat.

Commercial aircraft are pressurized to an equivelant altitude of around
7-8 thousand feet.

I regularly fly at those altitudes in my unpressurized aircraft with
the backup handheld in a seat pouch and the batteries are just fine.

Perhaps the batteries aren't as good as you think or the last charge
was longer ago than you remember.

All secondary batteries have a self discharge rate, some types are higher than others, a couple of months is more than sufficient to self discharge a battery pack. Another factor to take into consideration is that most modern handhelds do not have a 'hard' on/off switch. There is always a small standby current drawn. It is best to actually remove the pack from the radio.

As far as batteries on aircraft; I have never had any problems, and I can't think of a mechanism that would discharge them.

regards
Jeff

> Perhaps the batteries aren't as good as you think or the last charge
> was longer ago than you remember.

4 sets of batteries were all good order and fully charged the day before leaving and were all flat or almost flat on arrival.

I cant think of any reason why either. Its an odd one :o)

And it wasn't a one off, I've done this journey a few times, and had the same results. Its a long trip, UK to Australia, 3 flights, 22 hours in the air. But radio, camera and phone were not switch on during this time.

Suggestions welcome................

I think there are a couple of reasons for that:

1) The relatively-small amateur market won't support the cost of
standardization. IOW, it would add too much to the cost of a rig.

2) The rigmakers don't want any more interoperability, because it
means less sales

Isn't that true of almost any consumer electronics?

We hams are the exception that proves the rule. We tend to keep rigs
in working order for a very long time, compared to, say, VCRs,
computers or TV sets.

Note also that hams like N4PY have come up with aftermarket software
improvements for rigs like Ten Tec.

The idea is that you're either supposed to pay Motorola prices, or
replace the radios.

> Consider the problem with VCR's and the recent change in the start of

Good point! But the ability to add and change filters by firmware/
software methods is a major reason to go SDR.

Yup - been there, done that.

> I would
> welcome an amateur radio that had fault protection to keep me from

> blowing the finals if I accidentally transmitted into no load or an infinite load. I'm not so sure about an amateur radio that would keep me from transmitting out of band or in an unauthorized mode if assumptions about what constituted "out of band" or "authorized mode" changes, or if I find myself in a true, bona-fide, communications emergency.

One way to implement such protection is to have an override switch that must be activated for each exception. Or just a "feature off" switch.

> The Usenet newsgroup comp.risks (aka, "Risks Digest") has touched on many of these types of issues. For example, while a rev-limiter on a motor would increase safety by preventing a blown engine, putting speed limiters on automobiles to keep them within speed limits may increase accidents by denying the necessary amount of power to get you out of a reasonably unanticipated emergency situation while passing or merging.

I can't think of a reasonable real-world situation where an RPM limiter would cause problems.

Speed limiters, though, have practical problems. The max speed would have to be set higher than the highest legal speed limit in the country, so we're talking about 80-85 MPH. Since the car doesn't know if it's on a superhighway or in a school zone, the practical effect would be rather small.

> An airplane whose controls would keep you from overstressing the airframe, or flying into restricted airspace, might also keep you from making appropriate emergency maneuvers, where landing alive with your crew and passengers, but with an airframe you have just end-of-lifed, or under fighter escort to be whisked off to a friendly interview with the authorities, might be far preferable to the alternatives.
>

There's also the problem of what happens if the protection system fails.

It seems to me that the best implementation for ham rigs would be a firmware feature that you could turn off, and update as needed by downloads.

If these are commercial flights, are they going through
any kind of imaging screening equipment? What kind?

That is pretty darn clever. Does it have any special characters for backing up/corrections? I don't know if you've ever done it or not, but I suspect that it would be really easy to drop into "cw speak", which might be a little strnge for us native psk'ers. In any event, props go out to Elecraft for an innovative solution.

Excellent point Richard.

In recent years all luggage is x-rayed. My wife is a radiographer and always takes an interest in the machinery. She has never seen this particular type of imaging before. It shows different types of metal as different colours. Despite the commonly used name, its not really x-ray, indicated by the lack of concern of leaked radiation :o) Its definitely magnetic.

Could this be the battery killer?

Jack

>standardization. IOW, it would add too much to the cost of a rig.

STANDARDIZATION, nearly all of it industry standards, make up nearly everything in the component parts of any manufactured and nearly every home-built radio equipment for at least the last half century. Everything from fasteners (nuts and bolts) made to English and metric industry standards, vacuum tubes, resistors, capacitors, inductors, transistors and diodes (of the 'registered' 2N and 1N prefixes). There's industry standards on aluminum and magnesium alloys, even some on castings of same. There's industry standards on rack panels even though that was once started by AT&T for the telephone infra-structure. There's industry standards on wire (American Wire Gauge ruling through the market demand)...although those standards v. government specifications blur for heavier guages.

The 1%, 2%, 5%, and 10% logarithmic-sequence of parts values has become a de facto standard because of its ease in equating the parts' tolerances. The 'UHF' series of common RF connectors on amateur radios was originally a military specification but has become a de facto standard through its incorporation; the military doesn't use it now, hasn't for years, the patents on it have run out and it is a relatively cheap coaxial connector compared to other, better coaxial connectors.

>2) The rigmakers don't want any more interoperability, because it
>means less sales

Aeronautical Radio, Inc (ARINC) was once solely a commercial company engaged in providing air-ground communications with aircraft before our government got its act together and created the air traffic control system. They still do that but ARINC is better known to commercial avionics equipment makers as an industry Standards Group that, by common agreement of members, establishes standards on all civilian avionics equipment. Those cover everything from cases, their mounting equipment, even the control wiring with specified connectors and specific connections for control functions. ARINC standards have been acceptable to manufacturers and users for fifty years. The civilian avionics market is smaller than the USA amateur radio market.

The 'D-Star' VHF-UHF standard, currently under large promotion by Icom, may or may not become a standard. A lot of opposition to that standard is from US amateurs because it originated in Japan and was conceived and tested there. <shrug>

'S Meter' levels aren't really standardized as to receiver input signal levels except as a 'common use' standard and a recommendation by the IARU. Yet most are under the impression that all S Meters are calibrated/scaled alike (they aren't) and routinely report their S Meter readings in QSOs. :-)

Amateur radio equipment, especially transceivers, are designed and made for stand-alone use. Peripherals are relegated to outside-the-antenna-connector devices or different speaker boxes and other audio processing things. The external connections are standardized as to power input (AC standards from the power distribution infrastructure or DC power from the auto industry), computer interface connections (USB, serial, parallel) if those are included for read-out or computer control, and 'open-source' connections such as automatic antenna tuners made by the originating manufacturer or by independent suppliers. Microphone, headset/speaker, morse key connections still aren't standardized fully, not even as de facto standards; that allows more sales of adapters for that small niche market. :-)

I'm puzzled about all this palaver over some bandplan automatic lock-out on frequency control and transmitting. Allocations of amateur frequency and modes for same aren't locked to any standard but the common-agreement terms of the ITU-R. Sub-band allocations are always at the discretion of the national radio regulating authorities and may change at any time dependent on that nation's politicking for sub-band use. :-)

I've seen a LOT of different human factors documents and guides, but have yet to see a specific arrangement for manual control functions on any consumer electronics product. The 'need' for that seems to be no different for remote control via computer. Computer interfaces are very standardized now but that industry has had a quarter century to work those out; they evolved in the same manner as all standards did. Some have disappeared such as the 5 1/4" floppy and the 'Centronics' connector (Amphenol Blue-Ribbon); the 8" floppy and CP/M OS disappeared so early that few computerists of today know they once existed. :-) PC operating systems are standardized on the MS Windows package through agressive marketing and buyers agreeing to that despite the 'Linux' alternative.

De facto 'standards' will come about through a combination of manufacturer's marketing efforts and public acceptance...plus other manufacturers offering 'compatible' things to work with the apparent market-leader that started the de facto standard. That's how it was "forty years ago" and that's how it will continue to be. <shrug>

Yup.

Of course it means you have to know how to send Morse Code in order to do PSK31 or RTTY without a keyboard, but still.....

> Does it have any special characters for
> backing up/corrections?

Check the manual. It's interesting reading.

> I don't know if you've ever done it or not, but

> out to Elecraft for an innovative solution.

They've got a lot of them. Their manuals are worth a read
just for the ingenuity that went into the rig designs.

I got a chance to use a KX1 on Field Day this year. Amazing
little rig. Complete with accessory paddles, it's about the size of a
stack of QSL cards.

> Motorola just announced the intent to purchase Yaesu Musen.

Actually, they are buying Vertex, which owns Yaesu - and a lot more.

Which raises the question - will they keep Yaesu as a major amateur
radio manufacturer, sell off the amateur division, or shut it down?

Interesting times!

Ain't that the truth! There is so much ambiguity in S-meters that they are more for self comparison than anything else. I calibrated my S-meter during an antenna comparison a year or so ago, and they wen't in agreement, and they weren't linear - which is to say that while S-7 might be a bit high, and S-5 mogt be a bit low, and S-2 something else altogether.

Coupled with what I understand was a change in how many db were considered an S-unit to boot makes the S meter more of an entertainment device, or more likely one of the less important functions of the meter we use ot adjust power, alc, SWR and the like.

Certainly those who have the most need for the lock outs wouldn't
program them in anyhow. But I find it just an interesting thought exercise.

So are they just discharged? Can you recharge them?
Or are they destroyed? Were the radios affected?

If you can see the scanning equipment, can you at least
get a manufacturer name from it? And maybe a model
number? With that, you could do some internet research
to discover what method it uses and if there are any other
reports of bad interactions with batteries, etc.

In finding the cure for Vista, I've installed Ubuntu Linux on my laptop. It is turning out to be a tremendous OS, and it addresses one of my major complaints of most flavors of Linux - that being whenever you try to install a program, it takes you back to 1985 computing.

Any Linux lovin' hams here that have any advice or suggestions on good programs, such as logging, propagation or the other apps we like to have?

Indeed! My Morse code shortcomings are all on the receiving side. I can send fairly well, but I have to have a pretty clean signal to hear it easily.

Well so is my IC-761, as long as you can stack up a few thousand in maybe 30 piles.....

Seriously, the KX-1 is a nice little Xceiver.

The "Linux Hamradio Applications and Utilities Homepage" at http://radio.linux.org.au/ is probably the most comprehensive directory of Linux ham software. It's actively maintained and contains over 400 different software packages, sorted by categories like "logging", "morse", ...

I'm using Linux (and FreeBSD) for all my ham radio needs, which is mainly logging (YFKlog for normal QSOs, YFKtest for contests) and (very rarely) some digital modes (gmfsk, fldigi).

For some eyecandy, I am using xplanet to show me a world grayline map on my desktop background, with markers for all DXCCs (colour indicating cfmed/worked/needed). Of course, it's automatically generated by my logging software.

Furthermore I have a small script running on my workstation here which automatically check for new mail and send me the subject line and sender in morse code if something arrives.

There are very many little neat things you can do in an Linux/Unix environment with a short Perl/Python/Shell script, which is almost impossible under Windows.

I started using Linux as my main OS about 4 years ago. Since then, a lot has changed, both with Linux in general as an operating system becoming more and more available for the masses, but also in availability of decent ham radio applications. And I am a little proud that I made my own, small contributions to this. By making my own software available under a free license and by submitting bug reports, patches and suggestions to the numerous authors of excellent Linux ham radio software.

The standardization being discussed was about things like power
connectors and the possible feature of the rig not transmitting
outside
the licensee's privileges (such as no 'phone in the CW/data subbands).

btw, many of the parts in consumer and amateur electronics today
are "house numbered", particularly ICs, and replacements can be a
real problem.

Key factor there is "common agreement of members".

> 'S Meter' levels aren't really standardized as to
> receiver input signal levels except as a 'common use'

Even if S meter readings were standardized, differences
in antenna systems would make the readings meaningless
on an absolute scale.

> Yet
> most are under the impression that all S Meters are
> calibrated/scaled alike (they aren't) and routinely

Who are "most", Len?

None of my homebrew receivers or transceivers has ever
had an S meter. Yet I give signal reports as part of most
QSOs.

> Amateur radio equipment, especially transceivers,
> are designed and made for stand-alone use.

Most are, but not all. For example, the Kachina 505DSP, introduced about a decade ago, requires connection to a computer. Same for the Ten Tec Pegasus, introduced about a year after the 505DSP.

The inexpensive PSK31 transceivers commonly known as the "Warbler" is another example.

More recently, some software-defined rigs have been produced that require computer connection to operate.

> Peripherals are relegated to outside-the-antenna-
> connector devices or different speaker boxes and
> other audio processing things.

Isn't being "outside" the definition of "peripheral"?

Many rigs nowadays have numerous *internal* options as well, such as filters and firmware upgrades. These are almost always manufacturer-specific if not model-specific.

At least one company (Elecraft) makes their transceivers available with a wide variety of internal options that can be added at initial construction, or later.

For example, their basic K2 transceiver is a 10 watt CW-only 80/40/30/20/17/15/12/10 rig. Options include an antenna tuning unit, SLA battery, analog and DSP audio filters, SSB, 160 meters/second receiver antenna input, noise blanker, 60 meters, 100 watt amplifier, and serial port. Their other products offer similar options. But they are all specific to the manufacturer.

www.elecraft.com

> The external

Not on amateur gear. Some use Molex, some use PowerPoles, some use other connectors for DC power.

> computer
> interface connections (USB, serial, parallel) if those
> are included for read-out or computer control, and

My point exactly.

> I'm puzzled about all this palaver over some bandplan
> automatic lock-out on frequency control and transmitting.

What's the puzzlement? It's just a proposed feature.

> Allocations of amateur frequency and modes for same
> aren't locked to any standard but the common-agreement
> terms of the ITU-R. Sub-band allocations are always at
> the discretion of the national radio regulating authorities
> and may change at any time dependent on that nation's

The idea was that the rig could prevent an amateur from
accidentally transmitting where s/he wasn't supposed to.
Not just out-of-band but out of subband, even when the handy
frequency chart isn't available, or the operator doesn't look at it.

I'm afraid you will find that when you start installng many ham radio apps, you are still back to 1985. One of the reasons I'm kind of a fan of Fedora is that a number of ham related apps are part of the distro, and so install easily like those on Ubuntu. Those apps, tho, aren't your loggers and such, they are more the design apps that I happen to be interested in.

It doesn't have Ubuntu's eye candy, though, and unfortunately, Fedora is intended to be the "bleeding edge" distro, so about as soon as you get it installed it goes out of support. On the other hand, after many attempts, they have heavy-duty security that is pretty painless. It took them quite a few releases to get there tho, and the other distros haven't even started down the path yet.

I disagree: any Linux distro can be made secure, and just because Redhat has chosen "secure" defaults in Fedora doesn't mean that other distros can't be set for security.

Security is always a compromise between useability and effectiveness, and while Ubuntu may have chosen to set less secure defaults to obtain easier installation (or networking, or...), the _capability_ to set them is always there for anyone to use, not only in Ubuntu but in all the Linux distributions.

> In finding the cure for Vista, I've installed Ubuntu Linux on my laptop.

Its about the only current operating system that will work properly on a laptop.
Vista requires too much memory to work properly on a laptop.
We use Linux on all our business laptops now.

I would recommend trying the K desktop (distributed as "Kubuntu") because
the K programs can handle DVD's and other things more easily.
You can run K and Gnome and switch between them.

I think you miss the point. Fedora/Red Hat have chosen to use a new security model called SELinux that is far more secure than the old Linux UID based model, but a LOT harder to make work without really getting in the way. Most of the other distros have this model available, but getting it configured so it isn't a major PITA is a pretty big deal.

The system is a lot more granular than the legacy system, which means, among other things, that an attacker gaining root privileges still has very limited access to the system. With the old system, any sort of privilege escalation and its game over. That granularity means that there are a lot more things to twiddle, and a lot of thinking about what gets in the way and what doesn't.

Fedora bit the bullet back in FC3 (seems like ages ago), and finally by FC6 it had reached the point where it could be fully turned on and not be constantly getting in the way.

The thing about SELinux is that the compromise between useability and effectiveness isn't quite as stark as it is with the old UID system. You can have the system configured to be quite restrictive, and never notice that those restrictions are there. Getting all the policies set that way is no small project, however.

Of course you could turn it on with Ubuntu, but you would spend months, if not years, getting it configured so it actually provided protection while not raising it's ugly head every time you tried to do something. Red Hat has spent three or four years sorting out all those settings, and the default settings for Fedora are now pretty good.

When I was studying for the Technician test, I made a printout of the question pool and had it spiral bound at Kinko's (about $4).

I was thinking back a bit farther than that. Do you have the element breakdown for the 1970's and 1980's?

> > Please

Which brings us back to the present-day Technician license. The 10 meter segment is quite substantial and the Novice CW segments are still there, in the event that someone actually wants them.

Is there any data about how many no-code licensees ever use Morse?
I've seen a lot of wishful thinking among the old guard, but I don't
think that it is based in fact.

You don't have to worry about me mentioning CW . . . other than in disaster scenarios, almost all of my operating is on CW. I am a CW bigot, and it would be impossible for me to teach a class without letting my love of CW show.

But that view is very much not held by the members of the local radio club. None of them can understand how anyone could actually enjoy CW. I have tried to explain it, and I don't think I'm a bad ambassador for CW, but it just doesn't click with them. Mostly I just let the CW digs pass me by, but I have every intention of introducing CW (and other non-voice modes) in the class.

I am thrilled to hear that there is a desire to learn CW by people who were not forced to do so. I was hoping that would happen. I don't think *I* would have, so I tend to extrapolate my tendencies to today's new hams. It will be interesting to look back in a few years and try to determine how many new CW ops have come on board.

To some extent that's exactly what I plan to do. However, there are a number of concepts that aren't represented in the question pool with specific questions. That's one reason I need to draw the distinction between this being an introductory electronics class and it being a license class for the Technician class exam.

If some hams in your area have mobile setups (like I do in my car), invite
one of them to come over and demo it in the vehicle.

I would insist the group would have to be interrupted by a fire
drill... :-)

> By the time I took the 20wpm for the Extra two years later, they were

Well, according to Phil Kane, money is the real soul of the FCC.

I don't think it is that bad. I moved from the Midwest to California in November of 1956. The Field Office of the FCC is in Long Beach, CA, and that office doesn't look furnished in WWII-surplus.

I rather like my local area's Communications Auxilliary. It seems to have been put in place some time around the Attack on America ("9/11"). The Old Firehouse had been replaced by the LAFD years ago by a larger station somewhat close by...to all intents and purposes it looked like an unused building. But, inside there is a converted bus as a mobile radio station and there is a permanent base station in the rear of the firehouse which can do HF to UHF comms. The LAFD is responsible for the Communications Auxilliary and they kindly let the VEC do test exams there. Seemed like the Old Firehouse is still kept up nicely as if it could house a regular crew of firemen. We couldn't get to inspect the Auxilliary's radio stuff but could see in through a window set in the door.

>From the listing of amateur radio test sites, I could have gone to a Denny's Restaurant reserved room near me or a private residence somewhat farther away. At a mile away, the Old Firehouse and on a Sunday afternoon was better. Getting a closer look at one of the Communications Auxilliary's stations was a plus.

> The train ride was from Milwaukee; I suspect the Federal Building was

> station, but I suspect it was a similar experience

Heh, probably. I haven't been back to "The Loop" since then but been through Chicago Midway and, certainly, O'Hare, many a time since then, even a trip to Meigs Field right on the lakefront. But, 51 1/2 years ago I was just out of four years in the Army and could walk just about any distance needed. :-)   I wouldn't think of trying that walk now. :-)

One thing I remember being amazed at in a 2001 trip back to northern Illinois for the Big 50 Reunion of our high school class of '51 was that WMCW in Harvard, Illinois, was still operating. I worked there a few months in 1956 when it was literally a converted farmhouse. 500 W daylight only, it was "the voice of Boone, McHenry, and Walworth Counties" sitting just off a two-lane highway and I did the whole works as the only employee. The 'studio' was the old living room and the control room was converted from the former dining room. :-)   The farmhouse is gone and the studios for WMCW are now 'downtown' in Harvard, a bigger wide place in the road than it was 45 years prior. Only the single vertical for 1600 KHz remains, where I once replaced a mandatory warning light bulb that had gone out as a favor to the station owner, Esther Blodgett (of Blodgett Broadcasters).

I probably shouldn't sell the students short until I see who actually shows up. But the impetus for the class was a request from a couple of people who have already attended two previous entry-level classes taught by the radio club in the next town over. I saw their material; it's good; anyone who managed to attend their class and not pass is either unmotivated or unteachable.

> I suggest that if you have low expectations, the class will
> live down to them, and if you have high expectations, they
> will live up to them.

You have an excellent point, and I will try to act on it. On the other hand, I do have to be realistic. I have to adapt the material to the level of the people in the class, to the best of my ability and striving not to pitch it so low that part of the class gives up in disgust.

> With all due respect, if someone cannot grasp the concept of what
> a frequency is, they should not be a licensed radio amateur, IMHO.
> Such a lack of basic radio knowledge means the person just isn't
> qualified yet, and endangers both the person and those around them.

I think you've gone too far because I went too far in my example.

Let me try to say this in different words.

The students in this class live in rural Minnesota. Electronics is foreign to most of them. They can run a GPS-controlled tractor and cover their fields without double-spraying a single row, but don't expect them to understand the concepts of how GPS works. Or want to.

It's a real challenge to teach electronics to this demographic. For one thing, their motivation to learn the material is 100% related to passing the exam; they really couldn't care less that 1 amp will flow through a resistance of 1 ohm if 1 volt is applied. Some of it I can make "real" -- bring in a long extension cord, measure the resistance, discuss what that means when you put a welder at the end.

Most of these folks will never be electronics gurus. They don't need to be. They need to understand enough concepts to understand how to operate the equipment that they buy. Do they need to understand the relationship between wavelength and frequency to do that? No.

> The whole point of license testing is to insure that licensees know
> the basics.

I'm not sure that's actually true. Why do we care that a Technician licensee knows Ohm's law?

It seems to me that the point of license testing is to erect a barrier to entry. If that were not the case, the license pool would look a lot different. It would consist of regulations and practical knowledge that was actually used on a day-to-day basis. It would consist of material that, to use your phrase above, is essential to insuring that the licensee is not a danger to the person and those around him.

>> What I'm looking for is a real entry-level license, similar to the

>
> Then you need more time. It's that simple. The time can be
> class time, or it can be time the students spend reading and
> learning on their own. But it takes time to learn this stuff.

But I don't have more time. It's going to be hard enough convincing people to come to six sessions spread over three weeks. If I asked for more time, I would get no students. The goal is to figure out how to best use the time I have.

If I'm really successful, I will be able to lure people back to a followup class. That's the only way I'll ever get access to more of their time.

> "If it were easy, everybody would do it."

And we're back to the concept of the exam as a barrier to entry. If you have zero barrier, you have CB. If you have infinite barrier, you have no one entering.

Like everything else in life, this class is a series of tradeoffs. I picked six two-hour sessions as a compromise between having enough time to cover everything I want to cover and being able to attract enough people to conduct a class. I'll trade off time covering concepts to time covering specific pool questions since I owe it to the students to cover both. And I'm sure I'll be challenged to keep it simple enough for some students while trying to challenge the rest.

This is an interesting discussion, and I'd like to add my thoughts. CW vs fone is not unlike driving a vehicle w/ a standard vs automatic transmission. Or, in my case, bracket (drag) racing a standard vs automatic transmission. Yeah, it's easier to win when using an automatic transmission

but it's not impossible with a stickshift -- and doing so gives me more
satisfaction. Like you with the anti-CW digs, I let the digs against racing
a stickshift roll off me (for, they know not the joy of it).

> Perhaps one of the reasons that many people believe that the old time tests were so much more difficult is that at the time, they were for the test taker! Some yougster taking a General test back in 1957 would indeed find the test hard. After a few decades of college, practical learning, work, and experience, and a look at the new tests, one can be excused in thinking that they are "easy", because after all the knowledge accumulation, they are easy.

Precisely my experience! In my day to day work I picked up a LOT of electronics knowledge and experience.
NOT to BRAG but one day in 1983 I just happened to be in Detroit.
I just walked in and took the General test.
The secretary looked up my Novice license and then gave me the General test and I upgraded to Tech Plus (it ws just called TECH then).
The hardest part of the exam for me was the parts rules and regs that were just arbitrary like Band limits and how many days you had to respond to a violation notice.

Same with the EXTRA exam I took in 2000. Day to day working knowledge was more than enough to pass the exam.

>
> But not for everyone, and certainly the testing regimen should not be tailored to the highest denominator, so to speak.

No I think the exam should have more questions to test not just hit the high points but also test the depth of the testee's knowledge, that is I think the exam should have more questions, not harder just more questions.

As an FYI on the tests up to mid-2007, I've counted the number of pool questions from my printout of the pools available in Februrary 2007:

Technician pool had 392 (35 required). Ratio of pool to requred 11.20:1

General pool had 485 (35 required). Ratio of pool to required 13.86:1

Extra pool had 802 (50 required). Ratio of pool to required 16.04:1

The pools have gone beyond 10:1 by a fair margin...even if I've mis-counted slightly. My printouts (single spaced, both sides) FILL a 1" loose-leaf notebook.

Some time back I showed the notebook to an acquaintance who is an aspiring actor, not a radio hobbyist. He is used to memorizing lines of a script and being as letter-perfect as possible, his lines as well as others in the same scene. His main comment went something like, "Holy ##$%&!!! You had to memorize all that?!?" :-)

"No," I said, "Only certain things about regulations...theory and practice should be known enough to pass."

Out of 120 questions, I missed 6 (counting the marks made by the VEC team leader) and am sure that 5 of those were on certain regulations like bandplan numbers and satellite operation. That was satisfactory to me with 95 percent correct. I've got a little chart

of
bandplans and don't expect to get to outer space to operate
satellites. :-)

Did you exclude from that count the questions that were later disqualified? When I took the tests, most of the questions about band edges had to be dropped because of the rule change. A few others were dropped due to errors or poor wording. I think the current pool size has been chosen to allow for a safety margin for the elimination of some erroneous questions. (I am currently studying for the GMDSS operator test and the worst questions on the amateur tests are worded better than a large number of these.)

My figure of 8 or 10 pool questions to 1 test questions was very rough and not intended for 4 significant digit precision. However, other FCC test pools bring the average a bit closer to it, such as the GMDSS test pool (600 in pool, 100 on test).

Beat you. I got 100 on all three tests (amateur elements 2, 3 and 4). I will admit that there was some rote memorization involved, especially on the parts that I didn't know anything about (calculations involving imaginary numbers, for example).

unmotivated or unteachable.

I'm not convinced. Did you sit in on the classes and see what was
actually presented? Were the students able to attend all the classes
or only some? Good material, by itself, isn't going to guarantee
success.

> > I suggest that if you have low expectations, the class will

That's true of any class, isn't it? Particularly one where attendance
is 100% voluntary.

> > With all due respect, if someone cannot grasp the

I stand by my statement. There must be certain minimum
qualifications to be a licensed ham. That doesn't mean a
high level, but it does mean all hams should know the
basics of how radio works. Otherwise the whole purpose
of the ARS is undermined.

> The students in this class live in rural Minnesota. Electronics is

> Or want to.

I'm not saying they should understand GPS to a high level. But
being from rural Minnesota doesn't mean they are incapable of
understanding basic radio if presented properly.

> It's a real challenge to teach electronics to this demographic.

They don't have to *like* it, they just have to know it.

> Some of it I can make "real"
> -- bring in a long extension cord, measure the resistance,
> discuss what
> that means when you put a welder at the end.

BINGO! That's exactly it - tie the seemingly-abstract theory
to a real-world practical example. Another would be a demo
of why short thick jumper cables are better than long thin ones.

I can tell you from personal experience that most of a teacher's
job in such situations is finding an explanation that can connect
what the student already knows to what is being taught.

> Most of these folks will never be electronics gurus. They
> don't need to

> understand how to
> operate the equipment that they buy.

Agreed. The license tests are the starting point, too, meaning
the person who passes them has met the *minimum* qualifications,
not that the person is an expert.

> Do they need to understand the
> relationship between wavelength and frequency to do that?

Yes! (IMHO)

> No.

Sorry, that's one of the most basic things about radio there
is. All it really requires is an understanding that low frequency
= long waves and high frequency = short waves.
>
> > The whole point of license testing is to insure that
> > licensees know the basics.
>
> I'm not sure that's actually true. Why do we care
> that a Technician
> licensee knows Ohm's law?

Because it's basic to the operation of radio.

Real world example: There's a lot of electronics out there
that requires a certain minimum voltage to work properly.
Typically 11.5 volts or so for "12 volt" equipment.
Some things, like camcorders, have automatic minimum
voltage shutdown. Most ham gear doesn't have such
protection.

At least some amateur transceivers will emit spurious signals
if you try to transmit with them using too-low supply voltage.
Synthesizer unlock and similar stuff.
Spurs that can cause interference to other radio services.
On top of that, most rigs draw a lot more current on transmit
than receive.

So if our new Technician doesn't understand Ohm's Law in
at least a very basic way, s/he could hook up their rig using
wire that has too much R, and then transmit all kinds of spurs
because the rig is getting too low a voltage on transmit. Yet it

will receive perfectly because there's enough voltage when
not transmitting. Indeed, the ham could even start a fire by
overheating the power supply wires.

> It seems to me that the point of license testing is to erect a barrier
> to entry. If that were not the case, the license pool would look a lot
> different. It would consist of regulations and practical knowledge > that
> was actually used on a day-to-day basis. It would consist of
> material
> that, to use your phrase above, is essential to insuring that the
> licensee is not a danger to the person and those around him.

Ohm's Law isn't just theory. An understanding of it is a practical
necessity for radio amateurs. Otherwise they're not qualified to
do what the license allows.

> > Then you need more time. It's that simple. The time can be
> > class time, or it can be time the students spend reading and
> > learning on their own. But it takes time to learn this stuff.

> But I don't have more time.

Doesn't have to be *your* time.

> It's going to be hard enough convincing
> people to come to six sessions spread over three weeks.
> If I asked for
> more time, I would get no students.

How do you know?

> The goal is to figure out how to
> best use the time I have.
> If I'm really successful, I will be able to lure people back to a
> followup class. That's the only way I'll ever get access to more of
> their time.

At a certain point, they have to be interested enough to invest
the necessary time and effort.

> > "If it were easy, everybody would do it."
>
> And we're back to the concept of the exam as a barrier to entry.

No.

It's not about "barriers". It's about a ham knowing the basics.

> If you have zero barrier, you have CB.

I would phrase it as "zero requirements". But yes, you have cb.
And look how that turned out. Should amateur radio become
nothing more than high power multiband cb? I say no.

> If you have infinite barrier, you have
> no one entering.

Of course, but the license requirements are far from infinite. They're
just the basics.

Until 1975 the LA office was in downtown LA, and its last location was
on the top floor of the U S Courthouse.  When the judges made them
move, the deal was cut to move to Long Beach with G.I. 1960s-era
furniture. It helped that one of the engineers there (a good friend
and ham who rose to become the Western Regional Director but died much
too young 15 years ago) was a superior surplus scrounger who found the
newest-looking stuff.

Reading all the back and forth discussion of Steve's upcoming classes and his concerns... I'm getting really confused. When I was a teenager playing with CB, I didn't know nuthin' from nuthin' about radio, antennas, you name it. Once I became determined to become a ham, I eagerly learned all about it in order to pass my Novice, and then the General, and.... and at points when I saw the need (such as "gee, what is this 'swr' business?"), I learned more. So Steve, if you're so concerned about how these "students" are going to respond to your technical talks and related licensing materials, why are they even invited? Are they really interested in becoming hams? Or (at an extreme), are you recruiting potential hams like "Psssst! Hey kid - come 'eah - you wanna get a ham license?"

If they're going to whine about "Why do I have to learn this stuff??" then *I* don't think they deserve the privilege of a license.

Howard N7SO

I was and still am like that. A lot of radio stuff I learned simply
because it looked interesting or might be useful "someday".

But not everyone is like that. Doesn't mean they can't be
good hams.

> So Steve, if you're so concerned about how these "students"
> are going

Anyone with interest is invited. And any good teacher tries to
match the presentation to the students.

> Are they really interested in becoming hams?

That's the key question.

> Or (at an
> extreme), are you recruiting potential hams like "Psssst! Hey kid - > come 'eah
- you wanna get a ham license?"

Well, it's not quite like that!

The way I see it, people with interest should be welcomed and
helped. But the person has to take a certain amount of
responsibility to learn what's needed and to get set up. There's
a point where "help" turns into "doing it for" in such a way that
it actually works against the goal.

It's the old "give a man a fish/teach a man to fish" thing, aka
"learned helplessness".

> If they're going to whine about "Why do I have to learn this
> stuff??" then
> *I* don't think they deserve the privilege of a license.

It's not "whining" to ask why the requirements exist. All
license test requirements have to justify their existence.

The Basis and Purpose of amateur radio includes the
idea that hams will know at least the basics of radio. Ohm's
Law and the relation of frequency and wavelength are
pretty basic radio stuff, therefore, they belong on the test.

Simple as that.

I only counted the applicable pool questions. Yes, I also
printed out the NCVEC website listing of question changes,
but only as a very general reference, not to be used
specifically for my 25 Feb 07 test.   www.ncvec.org

>When I took the tests, most of the questions about band
>edges had to be dropped because of the rule change. A few others were
>dropped due to errors or poor wording.

I took my test before an ARRL VEC team. The ARRL-supplied
test question sheets had already excluded changed questions

(and answers). Good security was practiced by the ARRL VEC team leader and the other three in the team, all materials for testing kept in a small padlocked carrying box. Scoring templates were translucent plastic sheets, blue and imprinted with the ARRL logo, if memory serves me correctly.

> My figure of 8 or 10 pool questions to 1 test questions was very rough and not intended for 4 significant digit precision. However, other FCC test pools bring the average a bit closer to it, such as the GMDSS test pool (600 in pool, 100 on test).

After doing the total count of questions on my printout, I used a pocket calculator to derive the percentages. It has flexible significant digit settings and I used my standard setting of two significant digits in the fraction of percentages. I apologize if that offends anyone. [HP-32S II, cost $60 in 2001 off-the-shelf, just got an HP-35S, $60 still, the latest in the 35-year history of scientific pocket calculators, direct from HP on-line shop]

GMDSS testing would be done in front of a COLEM since it is a Commercial radio license group. Different from the VEC.

My First Class Radiotelephone (Commercial) Operator license test was taken at an FCC Field Office in Chicago, IL, 51 1/2 years ago. There were no COLEMs or VECs then and testing was not privatized. All commercial radiotelephone licenses were changed to the General Radiotelephone Operator License (GROL) much later and my First 'Phone was changed automatically to that. I kept that GROL renewed also until it became a lifetime license, no renewals required. I am not interested in obtaining any other commercial license now.

>> Out of 120 questions, I missed 6 (counting the marks made by the VEC team leader) and am sure that 5 of those were on certain regulations like bandplan numbers and satellite operation. That was satisfactory to me with 95 percent correct.

> Beat you. I got 100 on all three tests (amateur elements 2, 3 and 4).

I concentrated only on passing my three required test elements. I wasn't in 'competition' with anyone else but myself. The FCC sets the limits on the pass versus fail and the FCC grants the license. I passed. I mentioned my observed scoring only as an afterthought. The percentage of questions passed didn't seem to be logged by any in the VEC team. Scores aren't in the database from the FCC.

> I will admit that there was some rote memorization involved, especially on the parts that I didn't know anything about (calculations involving imaginary numbers, for example).

Complex number quantities are not an absolute necessity in amateur radio...unless one wants to be successful in designing certain parts of radio and electronics or doing a more in-depth realization of what actually comprises impedance or admittance. I learned complex number quantities from a third- or fourth-hand used reference on mathematics given to me in 1959. [I still have it and use it as a refresher on other math from time to time] They are not hard to learn, just a bit strange to those who haven't yet gone beyond scalar quantities. Both the HP-32 and HP-35S will do complex number arithmetic as a built-in function on the keyboard and the HP-35S has a much larger program storage.

I wish you well on your GMDSS test before a COLEM.

73, Len AF6AY

Let me try to address your questions and comments from Jim. I understand what you are both saying, and agree with much of it. But we have some basic disagreements.

Let's remind ourselves of the five purposes of the amateur radio service from Part 97:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.
(b) Continuation and extension of the amateur�s proven ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur�s unique ability to enhance international goodwill.

Items b, c, and d require technical knowledge of radio. Items a and e do not.

There are two reasons why I do not expect the students in my entry-level class to develop a detailed understanding of electronics.

First, this knowledge is not necessary in today's hobby. Sure, it's desirable, and it's necessary if you want to actually get involved in certain aspects of the hobby, like building your own equipment. But it is perfectly possible to participate in emergency communications, or to enhance international goodwill, and not know an ohm from an amp.

Second, most people today simply do not have any desire to learn radio theory. Does that mean that these individuals should be excluded from the ham radio hobby? I do not think so. It's certainly your prerogative to believe differently. Related to this, I know that most of these folks are "learning" this material simply so that they can pass the test and that within a couple of weeks they'll retain none of it. If that bothered me, I wouldn't teach the class.

In short, my goal is to get some new hams licensed. At worst, they can fulfill two of the five stated goals of the service. At best, they will discover the wonders of the hobby and get involved, and in that process they'll learn a lot more because they want to. I hope that I can help them get involved, but they'll never get involved if they don't pass that first exam.

I have about 18 hours of one-on-many time with these folks. I have to figure out how to "best" use this time. "Best" is really what we're talking about in this subthread. I'd love to give them a good electronics background, but that's simply not possible in 18 hours. My primary goal is to get them through the exam, and that factors into my definition of "best use of time".

I don't think that my standards are too low. I would rather give these folks an opportunity to be productive members of the ham radio fraternity than to insist on a burning desire from the beginning to learn about radio fundamentals.

Hi Len,

The bandplan frequencies and satellite operations are a real issue with me. I always thought that better questions were available, since like you note, you look at a chart. I do too.

At least with the band plans, the better question for the test would be to see if the testee knew where to look them up.

Steve Bonine wrote:

If I may interject here, I think we may be treating people as a group more so than individuals.

Some of those people in your class may just want to fire up the repeater and chat.

Some of them may just want to do emergency comms.

Some may want to build stuff.

Very importantly though, they may not know until they are exposed to it.

When I first became a Ham, my interests were in applying the hobby to my other hobby, amateur astronomy.

After that, I joined a club, and went to FD. I operated Field day with a control OP. I thought WOW! this is a lot of fun. So I went for my General Test. After Struggling with Morse Code - it is not easy for some of us, I got my General Ticket.

Then I discovered Digital modes, and a whole new part of the hobby opened up for me.

I kept on discovering things, the latest being how enjoyable HF Mobile is. I built my own bugcatcher, and have been surprised how well it works, given the low efficiency of mobile antenna setups.

My point here is that I discovered a lot of things about Ham Radio that I didn't expect, and they became the focus of my hobby.

Oddly enough, I never integrated Amateur radio as I had originally planned to, in Astronomy.

Don't sell the students short. Some of them may indeed just want to "pass the test". But by exposing them to a little of the different aspects of the hobby might just awake something in them that they didn't know existed.

Some thoughts for demos:

Obvious ones like the repeater operations.

An FT-817 with a miracle whip might be just the ticket for demonstrating SSB, CW and Digital. With all the "hot" setups out there, a less than mediocre setup such as this will still be able to make QSOs with.

I'd suggest going from FM to SSB to PSK-31, to CW, just to keep things lively. Could be done by bandwidth, with an explanation of how the smaller bandwidth signal tends to get across better. It's always good to have a sked setup with another Ham in case propagation is bad.

Another approach would be to have a sample chart with the segments labeled by their emission designators, such as A1A or J3E, and ask for the segment allowed to Phone or Morse, or Data, etc.

This would be independent of "real life" band plans or regulations, which are subject to frequent changes, and would test another phase of the knowledge of The Compleat Ham.

The California Bar Exam does just that - they give you a set of laws and a fact pattern and you have to write something - an argument, a petition, etc based on those, not on "real life" which can be something different depending on the latest court cases.

With all due respect, I think there's a bit of terminology confusion
here.

In amateur radio use, "bandplan" refers to voluntary, suggested usage
of frequencies,
not regulations. For example, AM operation on 75 meters centers around
3885 kHz
even though it is legal (for Region 2 Extras) to use AM anywhere from
3600 to 4000 kHz (as
long as the sidebands are inside those limits).

"Subbands" refers to the frequency limits in the regulations
themselves, by mode, class of license,
or both.

For example, 'phone modes are not allowed from 3500 to 3600 kHz for
any class of FCC-licensed
radio amateur in Region 2. That CW/data-only subband is part of the
regulations, not the bandplan.
Or the rule that only Extras can use 3500 to 3525 kHz, etc. -
regulations, not bandplan.

Yes, some hams do use the term "bandplan" to refer to the regulations.

But doing so leads to confusion, because the term usually means voluntary agreements, not regulations. Why not use the term that most clearly expresses the concept?

On 160 meters there are no subbands by mode or license class, but there is a bandplan! Same for 30 meters.

The problem with removing direct questions on the regs is that such an approach has a proven record of not working as a regulatory tool. Back when FCC licensed cb users, the license form required a signed statement that the licensee had read the regulations, understood them, and would follow them to the letter. Compliance with the regulations for that radio service turned out to be less than FCC anticipated, however.

Putting specific questions on the regs in the tests is one way of saying that knowing those regs is important for all hams. If they are replaced by questions about "where do you look up the band edges" or some such, why can't the whole exam be replaced by such questions?

Mike, I agree with you but don't see it as anything worth arguing
about.

>At least with the band plans, the better question for the test would be
>to see if the testee knew where to look them up.

That could be a solution. I'm still wondering about all those space
questions, though. Like there's not going to be many DXepiditions
to earth orbit specifically for radio amateurs.. :-)

With all due respect, Phil, a Bar Examination is for a professional license, not an amateur radio license. No one is expecting the theory part to be taken from a state Professional Engineer license, yet that would be as applicable in the same sense, yes?.

While there is so much hoo-hah about 'privatization' of amateur radio examinations, the NCVEC are all composed of licensed amateurs. They seem to have done good in the last two decades and one can communicate with them about what should be the questions. Could anyone but the FCC discuss things about the FCC amateur radio test questions before privatization? I ask because I was unaware that there was any possibility of suggesting anything about that before privatization.

Steve, from all the talk of the others and your very patient replies, I think you are doing the right thing with your preparations. It is very basic stuff you are doing and that is a good step, perhaps the best step for your Class of collected tabula rasas. I applaud your efforts.

Since I've been involved in radio and electronics (one way or another) for 6 decades, making the "Compleat Ham" (as Phil put it) just can't be done in 18 hours. It would take at least a thousand hours, perhaps two. Had it been that long a 'class' the drop-out rate would be large. As you say, some aren't interested in theory, some are only interested in certain aspects of radio. Those who only want VHF and up operation probably could care less about the ionosphere and all that long-distance propagation. But...the thing others haven't mentioned or others just gloss over is that you HAVE some that are interested enough to come for 18 hours.

"The journey of a thousand miles begins with a single step."

So far, the 'discussion' has been a lot of argument by others all about stepping, which way to go, etc., etc., ad something or other. I doubt that anything of that applies. They have taken the first nibble of the bait and aren't yet hooked, but I sense you can play them in.

PRESENTATIONS of anything are always better with a sense of theater about them. That involves the personality of the presenter, the prime focus of all in this classroom. Their interest must be held and focussed on the material and that comes from their sensing the presenter' mood and personality. Projection of the presenter to this 'audience' requies confidence and a friendliness with them.

Preparation and presentation go hand-in-hand. It is nice if you can do some audio-visual things but simple, easy-to-read-at-distance graphics will do. It breaks the flow a bit, but that's good. It lets the class focus on the material; they don't always have to watch the presenter. Being at ease in front of an audience is sometimes a toughie. It was for me the first few times, but I adapted to it. The ease of the presenter is absorbed by this 'audience.' Lack of ease will reflect in the audience drifting away from the presentation and they may feel uncomfortable.

Since I'm a bit far from you, I can't watch a rehersal of your presentation and suggest some improvement, but maybe there's one or more there who would be willing to stand in for the 'audience?' I don't know how much experience you've had before such an audience but I think you will get the feel of it right quick. You know the material. The only thing left is letting your enthusiasm rub off on the folks in class.

You've made the first step for them. Now it is time to extend your hand to have them follow. I hope they ALL follow you...and eagerly.

73, Len AF6AY

"Compleat Hams" are not made in class. They are "made" by participating in the hobby. Traditional classes should be a part of that participation (I have little patience with the people who say, "I don't have time to attend your class on emergency communication or participate in your exercise, but I'll be around when there's a real emergency") but experience is the real teacher. And you can't begin that experience until you pass that first written test.

> As you say, some aren't interested in theory, some are only interested in certain aspects of radio. Those who only want VHF and up operation probably could care less about the ionosphere and all that long-distance propagation. But...the thing others haven't mentioned or others just gloss over is that you HAVE some that are interested enough to come for 18 hours.

One of the things that continues to amaze me about the hobby is that it's not one hobby, but many. That's one of the things I hope to be able to communicate to the students in the class . . . not by preaching to them, but by describing the various aspects of the hobby (or by having someone who is passionate about "their" aspect come to class and expound on it). I do think that those who only want VHF should at least be exposed to propagation and how it works; how can they know if they might be interested in HF if they never even know it exists.

> "The journey of a thousand miles begins with a single step."

The journey into the ham radio hobby begins with passing a written exam.

I suppose that's not really true. The journey begins with deciding to take the journey. For these students, the "single step" is attending this class. That fact sure puts the pressure on the instructor . . .

> So far, the 'discussion' has been a lot of argument by others all about stepping, which way to go, etc., etc., ad something or other. I doubt that anything of that applies. They have taken the first nibble of the bait and aren't yet hooked, but I sense you can play them in.

I hope so. Time will tell.

As a related comment . . . when I started this thread, one of the issues I was trying to explore was walking the tightrope between "teaching the pool" and teaching a general electronics class. As I continue to prepare the details of the class, I'm realizing that teaching a concepts class based on the pool questions isn't really that bad. If the students come out of the class understanding the concepts upon which the pool questions are based, they will have a pretty good start at an electronics background.

There are some huge gaps, of course. For example, somehow the concept of inductance doesn't appear at all. But after living with the pool for a while, I feel better about using it as the basis for an 18-hour introductory class.

I'm sure that some of the students will spend their study time memorizing the specific questions from the pool. I hope that I have some students who will embrace the concepts. All I can do is present the material in the clearest and most engaging way that I can, let my passion show through, and provide the mentoring and encouraging environment to get them into the hobby.

> Since I'm a bit far from you, I can't watch a rehersal of your presentation and suggest some improvement, but maybe there's one or more there who would be willing to stand in for the 'audience?' I don't know how much experience you've had before such an audience but I think you will get the feel of it right quick. You know the material. The only thing left is letting your enthusiasm rub off on the folks in class.

I don't mean this to be critical of your suggestion Len, but I'm reminded of an article I saw last night on the network TV news. It seems that FEMA decided to give a news conference, and when no reporters showed up, FEMA employees pretended to be reporters and asked questions of the FEMA presenter. I'm afraid that rehearsals of this class, which would likely be held with members of the local radio club taking the place of the students, would be a lot like that. It would certainly be useful to do it, and I'm sure my presentation would benefit, but the "audience" that I get for the real class is likely to be much different from the "audience" that I would have in a trial run.

I think that the single biggest challenge I'm going to have is finding the right "pitch point" for this class. I'm expecting to have a few folks whose eyes glaze over as soon as I try to cover anything even remotely difficult and a few who will think that my level of coverage is much too general. Trying to keep the interest of the one group and not bore the other is going to be a challenge. I hope I'm up to it.

Yes, there's always one more place in what we call the Resource Pool Net where untrained and un credentialed hams can sit around and wait to be called - if ever. The days of a random appearance, HT in hand, are over in this era of Emergency Comm Centers and Incident Command Systems. They can't even get in the door of the comm centers today, and there are no resources available to train them to assist properly during a "real emergency". Knowing how to rag chew or work a contest doesn't quite cut it.

In real life the FCC exams were mode up by engineers who were knowledgeable in the fields being tested. I myself wrote several questions on television standards and measurements for the Radiotelephone First Class License revision in 1972.   The questions on the amateur exams were composed by staff engineers who were active amateurs.

Yes, there was a provision for input from the "outside" by writing a letter to the Examinations and Licensing Branch of the Field Operations Bureau with the suggestions. This was not a "secret" process, either, because lots of such letters were received and reviewed by the committee that was responsible for examination revisions. Some suggestions were accepted, others were rejected.

My gripe with privatization is that these are functions that should be done by the FCC, not by others. Dumping them on someone else is not the proper way to solve the problems that existed.

     Thanks for the correction Jim. I should have stated that what I don't
like on the tests is questions about what particular frequencies you are
allowed to operate on by your class.

> Putting specific questions on the regs in the tests is one way of
> saying that knowing those
> regs is important for all hams. If they are replaced by questions
> about "where do you look  up the band edges" or some such, why can't the
>whole exam be replaced by such questions?

     That is kind of slippery sloping my point. Knowing that we are supposed
to ID at certain intervals, or what a wavelength is, or what unit is
used to describe electrical power (all questions from the Technicians
test) are things that require some knowledge, and simply knowing where
to look them up would be troublesome and time consuming in a real time
situation if one had no knowledge of what they were - or even what, in
which case knowing would not be possible.

While printing out that nice little chart from ARRL and posting it by
the rig is simple to the point, and can be looked at before transmitting
to make sure you are within the limits.
```

Of course taking into account the bandwidth of the transmitted signal, another question that would be better on the test than the simple statement of frequencies.

Michael Coslo <mjc5@psu.edu> wrote:

> The major downside of all this is that as Emergency ops move toward this mode, the question arises of why they would be using amateur radio to perform the function at all - they might as well have their own system on their own frequencies, that they alone use.
>
> - 73 de Mike KB3EIA -

One of the REAL Reasons that Amateur Radio can play a part in Emergency Comms, is really very simple, and usually not thought of, in many Govt. EMS/Enforcment Groups.

What happenes when the Repeaters, and or Remote Bases, are lost due to Power Loss, FIRE, or EarthQuake, at the High Point Remote Locations that the EMS/Enforcment System uses, or secondly, what happens when the Telco Links from the EMS/Enforcment Comms Center fail, due to these same situations and the CommCenter can work the Repeaters and Remote Bases via RF Links but can't communicate with the next higher Govt entity?

Cases on Point here. World Trade Center Collapse.

All local South Mannhatten VHF and UHF Remote Base and Repeaters for New York, as well as most of the other Govt. Frequencies were installed on Top of the WTC. When it collapsed, they lost 95% of their Repeated, and Remote Base Comms, and couldn't talk to each other except on one or two simplex Emergency Backup Freqs, that weren't common to ALL the EMS People from ALL the Mutual Aid Responders.

LA Fire a couple of years ago.

Again, 90% of the local Camms were taken out when one of the MAIN Remote Base and Repeater Location up on the Rim of the World Highway was caught in a Flashover during a major fire. None of the equipment, that was inside the building was damaged, but ALL the Coax, and most of the Antennas were destroyed by the heat of the fire, causing these systems to be OFFLine from that point, untill MONTHS later when the tower was rebuilt.

Our EMS People depend on their Comms to work, and work reliably, in oreder to be effective in thier jobs. when these systems fail, they can still work their individual jobs, but their effectivness as a EMS System is greatly reduced. A good Emergency Plan, with TRAINED Volenteers, and Backup Equipment, and Frequencies, can help keep these EMS folks effective.

How many EMS Systems have a Backup, Mobile, EMS RemoteBase and Repeater Comm Infostructure, ready to deploy, should the fixed Infostructure Fail?

Is there an Backup EMS/Enforcment Comms Policy, inplace, that sets the rules for use of the minimal Simplex Frequencies that will be common to ALL Mutual Aid Responders, for a given Massive Comms Failure, and who is in charge of that traffic, and getting the traffic to the right places.

The Feds have been trying to deal with these senerios since 9/11, and are just NOW, starting to get a handle on SOME of the problems, and solutions, that will be involved.

We see the RED Cross, starting to require their volenteers to be Credentialed. I understand that SOME of the Enforcment folks are issuing Limited Credentials to Trained Ham Club folks that they have used before, and incorporate into their Backup Emeregency Comms Policies and Proceedures.

All this is just for local EMS/Enforcment Comms, but who can provide the Long Distance Comms, to the higher Govt. Entities, when the longlines are out. This was a MAJOR problem in the Post Katrina New Orleans Senerio. The National Guard usually HAS the equuipment, and MAY have the personnel, but are they ready on a moments notice, or does it take Days to ManUp and Deploy. Wouldn't it be nice if the Hams via their own Club System, could have a BackUp Emergency Comms Plan and Policy to provide such Systems from Local to County, and County to State, should their be an urgent need, should disaster, of these magnitudes, happen.

Bruce in alaska   just one of many, who actually Think about
                        such stuff......

I definitely agree that this should be a possible test question as one can
be out of band simply due to the width of the signal. A lot of people don't
understand this until they get "dinged" so to speak. When I teach a class,
I try to emphasize this.

Dee, N8UZE

Our district-wide ARES/RACES groups have several repeaters licensed to members so no "commandeering" is necessary. In addition, we routinely test simplex paths between our served agencies in case repeaters go down for any reason.

>
>Even in our area, whole groups of folk have been getting licensed in
>this reverse manner. We have ambulance drivers, paramedics, comm center
>staff. I suspect in the near far term, we won't be getting in the door period,
>unless we become some kind of semi professional unpaid volunteer.

We've kicked this around too. All of our active members have been "vetted" by the state police for RACES ID cards and most of us carry Sheriff's Office entry passes (picture ID, not law enforcement officer credentials) that are necessary to get into facilities where the SO provides security.

We've also kicked around the situation where in our hospital we have to go through the Emergency Room entry area to reach the EOC, and the ER docs and nurses are empowered that if during an emergency/lockdown they see anyone in the ER whom they do not recognize they are to have security detain them for interrogation. For that reason those of us who serve hospitals also have hospital picture IDs issued by the security department.

Welcome to the 21st Century.

I think a new class of Ham is inadvertently coming about - that
>of the quasi-professional ham - one who is employed in a field that
>occasionally calls on them to use their amateur radio license in pursuit
>of their work. Note that the FCC has upheld this as legal IIRC.

Most, if not all of our served agencies have ruled that in a "real" emergency, the employee does his or her regular job, not serve as part of the Amateur Radio teams. We have MOUs with the served agencies that we will provide the necessary comms if their regular comms become unavailable.

The only exception is with the HEARTNET role as the secondary backup for the inter-hospital ER status and reporting system carried on 800 MHz with a primary backup of 155 MHz, and if both of those "commercial" services go down, the 146 MHz simplex net is used by ER personnel who are licensed hams. We have no problem with that because the traffic that would be handled is very medical-specific and decisions have to be made "on the fly" over the radio, and it's better to have the RNs do it than to have to pass messages through non-medical personnel.

>The major downside of all this is that as Emergency ops move toward this
>mode, the question arises of why they would be using amateur radio to
>perform the function at all - they might as well have their own system
>on their own frequencies, that they alone use.

And they do. We are the "whenever all fails, we are still there." And the "modern" 800 MHz systems are virtually useless when things get hot because of either system hardware failure or priority public safety traffic making the system unavailable to "lower on the ladder" users.

A very small payback for the privilege of using the spectrum that we get.

There you have it. I would say that those who are running the show are very VHF/UHF centric. They don't know about long distance radio, except for perhaps satellite Operations, which are still line of site. Someone somewhere has to know what bands to use at what time and for what distance.

<A bunch of good stuff snipped>

> The Feds have been trying to deal with these senerios since 9/11, and

Your post is pretty accurate, Bruce.

One of the things that I want to add is that while Amateur radio was one of the few things that worked very well, those who are in command are bent on turning it into something more like what failed.

I believe that the present day post 911, and even more post Katrina emphasis on emcomm Amateur radio is imposing a structure upon those Hams who would volunteer their time, when in fact, what has allowed Ham radio to work in emergencies is that very lack of structure among knowledgeable Hams who in a random fashion come forth and offer their services and know-how to the problem at hand.

I believe that imposing a structure on the ARS, and bringing it into the fold, so to speak, will increase the chances that Amateur radio will be the one to fail along with other parts of the emergency operations.

As we are called upon to have our backgrounds checked, our lifestyle and financial dealings investigated, and resign ourselves to hauling out the trash or unloading trucks, there will be less of us willing to spend our vacation time or even simply lose money to offer our services.

At that time, most of what will be left is those quasi-professional technicians who are licensed to talk, but know precious little else about how to make sure the comms continue. Then comes failure.

It's a real problem, because those who make the decisions can only see solutions as application of structure, and if there is a problem, the answer must be more structure. Its like the old saying "If your tool is a hammer, all problems look like nails."

This is a very controversial position for sure, as witnessed by local Emergency people's reaction when I bring it up. My only suggestion is for people to look at what causes failure, and correct it. Some times what seems like a good idea is what causes failure. If that is the case, no application of more of that "good idea" will create success.

Most, if not all, of our served agencies have or are getting HF
transceivers for "long distance" communication. If the repeater
and/or packet relays go down, that's what we have to use to connect to
state and regional EOCs, usually by NVIS facilities.   Most of our
leadership have those in their home stations as well. Some of us are
looking into automatic interchange between VHF to HF for digital
traffic. We aren't content with a "shack on the belt" approach.

Perhaps your local setup is doing well, Phil, I can only see what is
happening locally, and what I get from the news.

I suspect they have some good people running the show there?\

how many mobiles will premit out of band op Dee? none of mine will

only on HF can this be an issue since only hthere does the rules contiue the
insanity ofparts of bands to deferent class (amoug the classes we still
issue)

: : : : Thanks for the correction Jim. I should have stated
: : : : that what I don't like on the tests is questions
: : : : about what particular frequencies you are allowed
: : : : to operate on by your class.
: : : :
: : :
: : : Yet there are times such as mobile or portable
: : : operation that we don't have that band chart with us.
: : : So it's nice to know our frequencies.
: :
: : how many mobiles will premit out of band op Dee? none
: : of mine will

They can be programmed or modified to.

For example my Icom IC-V82 2m handie will transmit anywhere from 136-174
MHz. This was apparently necessary to allow it to operate on the US 2m
band 144-148 MHz. Here in Region 1 (UK) we only have 144-146 on 2m so so
in order to keep the warranty intact, I asked the importers to modify it
for the US band when I bought it, as I travel there on holiday regularly.
They told me that opening it up to 134-174 was the only way it could be
done, apparently the firmware in US versions that cover 144-148 only is
different.

Last December, some hams in my town put on a "Ham Cram" one-day study and license test for Technician Class. One week ahead of time, the students received a print-out of the question pool. On Ham Cram day, from 7:30 AM to 1:00 PM they were drilled on the questions, with the correct answer being stressed. After a lunch break, at 2:00 PM my VE License exam team arrived to test them. 13 of 14 passed. BUT, I have had contact with several of these students since the Ham Cram, and they had almost no practical knowledge of amateur radio. They required A LOT of Elmering. IMHO, lessons spread out one night a week for a couple of months, with practical demonstrations and discussions of ham culture would have made much better hams.

There is very little math on the Tech test. If you can't remember to divide the number "300", you probably won't remember the rest of the answers. However, experience makes a good ham, not knowledge of the answers. I am an extra class ham, but I realized that without experience or a fundamental knowledge of electronics, I really couldn't do much more than push a button and chat.

All HF rigs that I have permit one to set and transmit SSB in the CW/Data portion. That is operating out of band. Happened to a lot of continental US folks last weekend in the CQ WW contest. I suppose they got excited and weren't paying attention to the frequency readout.

> only on HF can this be an issue since only hthere does the rules contiue

You are overlooking the splits by mode. For example it is against FCC rules for continental US stations to transmit any voice mode in the CW/DATA portion.

>>

Even if there is a question in the pool, it may not show up in an actual test. Basically the pool needs to contain several questions of this type to insure that one does show up on the actual test taken.

All the HF amateur rigs I have seen will also permit one to transmit data modes in the 'phone/image subbands, which is also against US regs. Some will permit things like too-wide-for-the-regs FM on HF, too.

> That is operating out of band. Happened to a lot of continental

Or they don't know the rules well enough to apply them all the time.

> For example it is against FCC rules
> for continental US stations to transmit any voice mode in the CW/DATA

Whether we like it or not, subbands-by-license-class are a reality for FCC-licensed amateurs. That's a reality which isn't going to change soon, because FCC has repeatedly denied all proposals to eliminate subbands-by-mode or subbands-by-license-class on the HF amateur radio bands. We might someday go to subbands-by-bandwidth, if someone can come up with a reasonable proposal, but the situation won't change much if that happens. We'll still have the case of 'you can't transmit that mode on this frequency'.

There's also the fact that we US amateurs - all of us - are allowed by the regs to design, build, repair and modify our rigs, and they don't have to be formally type-accepted or certified. So it makes sense to require us to know the regs rather than expecting our rigs to prevent our mistakes.

> Even if there is a question in the pool, it may not show up in an actual

Even if the question shows up on the test, the person can get it wrong.

IMHO, one of the fundamental weaknesses of the written tests today is that all subjects and questions are lumped together so that a person can have huge holes in their knowledge yet still pass. This is of particular concern because the holes can be in subjects like safety and regulations.

I think it would be better if each test were broken down into subelements-by-subject, and marked in such a way that you'd need a passing grade in each subelement to pass the whole exam.

Remember that the exam is built by choosing a given number of questions from each subelement. For example, there are four questions on the Tech exam from subelement 1, which is FCC Rules and station license responsibilities. When the pool was constructed one of the aspects was a weighting of the various topics. There are, for example, only two questions from subelement 7 (Operating in the field. Contests. Special events. Satellite operation).

I don't envy the committee that formulated the pool. No matter what they come up with, a lot of folks will criticize it. A fine example of a thankless job.

Dick Grady AC7EL wrote:

> Last December, some hams in my town put on a "Ham Cram" one-day study and license test for Technician Class. One week ahead of time, the students received a print-out of the question pool. On Ham Cram day, from 7:30 AM to 1:00 PM they were drilled on the questions, with the correct answer being stressed. After a lunch break, at 2:00 PM my VE License exam team arrived to test them. 13 of 14 passed. BUT, I have had contact with several of these students since the Ham Cram, and they had almost no practical knowledge of amateur radio. They required A LOT of Elmering. IMHO, lessons spread out one night a week for a couple of months, with practical demonstrations and discussions of ham culture would have made much better hams.

I think that the optimum recipe for baking a new ham is first a class that teaches basic concepts based on the pool questions, then the exam, followed by a combination of classes and one-on-one Elmering to get the new hams on the air and integrated into the ham-radio community.

If you present a prospective ham with the prospect of a class that continues for months they're likely to be intimidated to the point of deciding that they can't make that level of time commitment. The trick is finding a scheduling scheme that gives you enough time to do more than just go over the pool questions but doesn't scare away all the prospective students.

A one-day cram might be a good starting point *if* there is plenty of followup support and the new/prospective hams are encouraged to do more than attend the one-day class, pass their written test, and then never get involved with the hobby. Personally, I don't care for cram sessions, but some people do, and they have the advantage of providing an opportunity to get people "hooked" and thereby get them into appropriate followup activities. They also have the potential for being such a negative experience that they turn off prospective hams. Everything is a trade off.

The key to getting new people involved in the hobby is to pique their interest enough that they follow through. Back in the "good 'ole days" the allure of radio technology was enough to attract folks, many of them teenagers, into the hobby. In today's world, radio is pretty "low tech" and this natural attraction is diluted by newer bells and whistles. We need to do the same kinds of public relations and marketing that is done by other activities that are competing for peoples' spare time. We need people to read or see something that makes them think, "Gee, that could be a rewarding activity." You can offer all the entry-level classes you want, but if no one is interested enough in the potential of ham radio to attend the class, nothing is gained.

That's not to say that I have any magic answers on how to do this. I do see a trend of more "middle aged" recruits coming on board these days -- people who have had the idea in the back of their heads for years of getting into ham radio, and finally have time to act on it. My experience is that many of these folks see an article about ham radio being used for some aspect of public service, and that's what re-kindles the latent idea, but I have no real scientific basis for that belief. I think it would be a good use of ARRL funds to do some market research in this area, figure out what it is that's motivating people to enter the hobby, then use that knowledge to improve our PR.

As an aside, for those who might be interested in the class that was the impetus to start this thread, I've got ten students and I think that things are going well. Most of the students are interacting in the class and seem to be enthusiastic about what they're learning. (Well, perhaps "enthusiastic" is a bit of an overstatement since much of what we discuss is dry regulations, but at least I haven't heard any snores yet.) Of course it is much too early to tell how successful we will be since I will judge that based on how many of these folks I hear on the air and see at local ham-related activities six months from now.

I agree with this, but it brought a question to my mind.

The new generation of HF transceivers -- the ones that have quite a bit of computing ability built in -- do they have the ability to enforce sub-bands? Certainly they *could* have that ability, since they already "know" the band edges and in most cases won't allow you to transmit completely outside a band allocation, but why not support the next step and not allow SSB in the CW band?

I don't think that most folks who find themselves doing something stupid like using SSB outside of the US sub-bands do so because they don't know the regulations. They get caught up in the excitement of a contest or chasing DX or their mind slips out of gear, and when they realize what they've just done they feel about two inches tall. I would like to see the flexibility in a piece of equipment that I just shelled out big bucks for to keep me from doing this, while at the same time giving me the flexibility to program the segments that apply to my license class or if I take the rig to a different location where the rules are different.

Or maybe this is already a feature of the new rigs. I wouldn't know, not having bought any HF equipment in this century.

Steve, I've got to agree with you 100% on that. :-)

I did pause a moment to reflect on a few years of lots of folks' comments, on-line, off-line, in-print, in-person. There's some relationship to "instant gratification" that is a catch-phrase in all the complaints. As I sense it, all the "experienced experts" on everything want the TEST to prove all successful applicants become Instant Experts almost as good as the complainers. :-)

The predecessors of the FCC and the FCC itself continued to use licensing (and tests for same) as a regulatory tool for their lawful charter of all US civil radio. It was never, ever intended to be any academic test good enough for award of a degree in a subject...yet so many others blur the distinct difference of an amateur radio license TEST verses expertise a la academia.

Back when the FCC 'personally' tested radio operators, it was proclaimed a 'Real Test.' From expeience of many of my contemporaries, that 'reality' didn't exist. There was no way one could 'test' for radio equipment of 1956 to make anyone 'expert.' When the FCC revamped a lot of their work to include privatization - which included Frequency Coordinaton of many PLMRS users as well as amateur repeaters - it became a 'bad thing.' The TEST was no longer 'real' since all the questions and right-wrong answers were public...which came about through other political work, not the fact of privatization.

I cannot see where the Volunteer Examiner Coordinator system is so 'bad.' It is composed of active fellow amateur radio licensees and I doubt that any of them could be considered dummies. That's better than having questions and answers thunk up by a faceless few at the FCC, ones whose primary task is radio regulation, not boosting amateur radio nor trying to get more licensees. All in all, I think the VEC QPC is doing a FINE job given their virtual free rein on what to ask in every test element.

It is even better when one considers the first word in their description: Voluntary. Those on the Committee have guts as well as experience in volunteering for a sometimes thankless task. I salute their work and dedication (with all five fingers, properly) for keeping up that task for two decades (give or take).

That separates the "Compleat Ham" who is in control of the station
from the "appliance operator".

```
>while at the same time giving me
>the flexibility to program the segments that apply to my license class
>or if I take the rig to a different location where the rules are different.
```

An interesting thought.

```

>Or maybe this is already a feature of the new rigs.  I wouldn't know,
>not having bought any HF equipment in this century.
```

I acquired an Elecraft K2/100 about 18 months ago. It has been augmented by the K3 now. Both are top-of-the-line HF rigs in kit or modular form (think of a Heathkit on steroids). Neither has the feature that you are describing.

http://www.iaru-regionii.org/Region_2_MF__HF_Bandplan_Annex__1_2008.pdf

This plan is supposed to go into effect Jan 1 2008. It's a voluntary plan, not FCC regulations.

IMHO:

Good Things:

1) The general idea of sorting modes by bandwidth is a valid one. Narrow and wide modes just don't mix well.

2) The plan puts 'robot' (unattended) stations in well-defined places, rather than letting them wander all over the band.

3) There are centres of activity - watering holes - for various activities, like image transmission. This does not mean they can't go on other places, just that there's a defined place to meet.

Bad Things:

4) The plan almost completely bans AM voice! From 160 through 10 meters, AM is only allowed on 3600-3625 kHz, 3875-3900 kHz, and 29000-29300 kHz. On all but 10 metres, AM is an asterisk to the 2700 Hz bandwidth.

5) The plan does not agree with other, similar plans, such as the ARRL bandplan. It seems to me that the IARU Region 2 bandplan and the bandplan of the largest amateur radio organization in Region 2 should at least agree.

The no-AM thing is a big one to me, even though I'm a CW operator. AM is a perfectly legal mode on all US HF/MF amateur bands except 60 and 30 meters, yet the plan says that 'good amateur practice' is to not use AM *anywhere* below 29 MHz except 50 kHz of 80/75 meters. And that's regardless of propagation, number of hams on the band, contests, etc.

This sort of thing sets a very bad precedent. It effectively makes the use of a perfectly legal mode 'bad practice' on all but a small percentage of the available-by-law spectrum, and on all but parts of two bands.

Now some may say "it's just a voluntary bandplan, not a regulation". And that's true, but it's not the whole story.

When interference problems between amateur operations have arisen that do no involve clear Part 97 rules violations, FCC has usually ruled on the side of the amateur operating in accordance with the voluntary bandplan in effect at the time. The most-common example I know are cases where an uncoordinated repeater and a coordinated one have interference issues. AFAIK, the uncoordinated repeater always loses because coordination is good amateur practice. But coordination is really just a form of voluntary bandplan, since we amateurs administer it, not the FCC.

It seems to me that under the IARU plan, if I were to operate AM on, say, 40 metres, and an SSB station were to complain about interference from me, I'd be on the defensive from the getgo because, by definition, the SSB op is operating in accordance with the bandplan and I'm not.

Most of all, if they can do it to AM, they can do it to other modes. Once the precedent is set, it's just a matter of expanding it.

It seems really odd to me that while recent FCC rules changes widened many of the phone bands, particularly on 80/75, this bandplan drastically reduces and eliminates them for AM.

Again, IMHO, the IARU can do better.

As a little counterpoint to the issue, I was licensed first in 1999 (rank newbie - HA!) and took my first Element one test in 2000.

Well, I flunked it.

What I remembered though was the examiner who labored over trying to find the different ways that I might have squeezed through and actually passed the thing. But it just wasn't to be. Poor guy was so apologetic and felt so badly that I ended up feeling badly for him.

So much depends on our outlook, but I would trade that guy's kindness and eagerness to get me into the fold, over being intimidated by the steely eyed examiner. It made me look forward to passing my test and getting into that fraternity. Which I did a few months later. And passed.

Ah . . . back then, the 5 wpm code test was not administered by the FCC, at least not for the Novice ticket. It was administered by your fellow operator, as part of the examination for Novice.

I gave a number of Novice exams back then, and it was always a pleasure to do so. I also taught a number of Novice classes, most of which was code, and enjoyed doing it. Mostly I think my students enjoyed it, too.

So we got both experiences . . . an Elmer's kindness, plus the steely eyed examiner <grin> (Although my memory of the examiners in Chicago is a pretty positive one.)

Juergen,BX3/DJ3KR, will stay in Taiwan between Oct 18 and Nov 5 and plans to hit the airwaves in all modes on all bands. QSL via homecall.

CT3 - MADEIRA, AF-014

A German group (DJ6QT, DJ7JC, DK8NC, DL8OBF) stays on Madeira (AF-014) from Oct 16-30 and plans to show up as CT3/homecalls on all bands. They will sign CT9L during the upcoming WAG and CQWW SSB Contests. QSLs for CT9L via DJ6QT, all other QSLs via the operator's homecalls.

HI - DOMINICAN REPUBLIC, NA-096

After being in Senegal for a while Dani,EA4ATI, has been staying in the Dominican Republic for a few months now and finally received his license (HI5/EA4ATI). He is working with 100 watt and dipole. QSLs via homecall.

HS - THAILAND

HS0ZHR (OP SM1TDE) has returned to Sweden. He had to leave Thailand much earlier than expected.

SP - POLAND

The special event station HF100SK marks the 100th anniversary of the scouts in Poland. It is working from Skierniewice till the end of 2007. QSL via SP7ZIA.

SU - EGYPT

SU50JOTA remembers 50 years of JOTA and will be QRV in CW/SSB on 15/17/20/40/80m from the "International Scout Centre" in Kairo on Oct 20/21. The team members are SU1GS, SU1SA, SU1AO, SU1KM, SU1KA, SU9NC, SU1SK. The QSL manager is SU1SK.

T6 - AFGHANISTAN

John,KE6GFF, will be QRV again from Kabul signing T6EE between Oct 18 and Nov 13. His preferred frequency is 14.210 MHz and he plans to take part in the upcoming CQWW SSB Contest as well. QSL via home address: John Kountz, 1065 van Dyke Dr., Laguna Beach, CA 92651, USA.

V3 - BELIZE, NA-073

John,W5JON, and his XYL Cathy,W5HAM, will be active from the island Ambergris Caye (NA-073) from Oct 25-31. Listen for V31FB in SSB on 10-160m (also in the CQWW SSB Contest) but he also likes to make skeds for 160m. Cathy prefers the beach holiday. It was many years ago when she promised her husband he may go anywhere for contesting as long as there is also a beach! Now they are going to visit Belize for the fifth time. John will use an IC-7000 plus a 400 watts amplifier and has a free sight to Europe.

V4 - ST KITTS AND NEVIS, NA-104

Scott Andersen,V4/NE1RD, is going to the airwaves from Oct 24-31. He hopes to set a new record in the QRP category of the WWDX from the island of St. Kitts (NA-104). You can get eQSLs, LoTW confirmations and also regular paper QSLs via bureau or direct. SWL reports are welcome.

VK9/L - LORD HOWE ISLAND, OC-004

Haru,JA1XGI, will be active as VK9GLX in CW/SSB/RTTY/SSTV on 20/30/40m and possibly also on the lowbands from Oct 19-22.
QSLs via bureau or direct to JA1XGI or direct only via W8XGI.

VP5 - TURKS AND CAICOS ISLANDS, NA-002

VP5/WA2VYA, VP5/K2WB, VP5/W2WAS and VP5/N2VW will be QRV in CW/SSB especially on the WARC bands from Providenciales (NA-002) on Oct 23-30. They will use the call VP5T during the CQWW SSB Contest (QSL via N2VW). All other QSLs should be sent via buro to the OPs homecall or via LoTW.

XU - CAMBODIA

A Finnish/Belgian team consisting of Wim,XU7TZG, Reijo,OH4MDY (XU7MDY), Anni,OH4JGE (XU7JGE), and Jack,ON4AJV (XU7AJV), was announced to become active from Oct 20 until Nov 5. Following QRGs have been published: 1825, 3507, 7003, 10104, 14007, 21007, 24897 and 28020 kHz, but the lowbands will be emphasized.Listen for XU7MDY in a single band category of the CQWW SSB Contest. Unfortunately QSLs only direct.

3V - TUNISIA

The "Gold Jubilee of the JOTA" will take place from Oct 19-21 and the "Tunisia Scouts Amateur Radio Club" celebrates its 10th birthday during the same time. Listen for 3V8CB and 3V8ST QRV sein, mainly in CW/SSB. QSL cards only via bureau, NOT direct!

4O - MONTENEGRO

The radioclub of the "Council of Europe" and Ranko,4O3A, are going to activate the new DXCC counter Montenegro using the call 4O0CE from Oct 17-21. Reason for that is that Montenegro has joined the Council of Europe last May. QSL via F5LGF.
Online logs will be available at: http://ewwa.free.fr

6W - SENEGAL

Jovica,T98A (ex-ST2A), has passed the Senegalese license exam now and promised to be very active as 6W1SJ for the next two years. Jovica preferably works in CW, but also some SSB and digital modes. There are good chances he might activate also other African countries from there.
QSL via T93Y: Boris Knezovic, Box 59, 71000 Sarajevo,Bosnia-Hercegovina
QSL via bureau or e-mail requests (t93y@lol.ba) are possible as well.

6Y - JAMAICA, NA-097

John,W2GB, will be QRV as 6Y0B from Oct 23-30, including the participation in a single OP category of the CQWW Contest. QSL via W2GB.

A3, 5W, KH8, ZL - SOUTH PACIFIC TRIP

Willy,ON5AX, and his XYL Magda,ON3AX, are travelling the South Pacific Ocean between Oct 17 and Dec 14. They will be QRV in CW/SSB/PSK on 40m/30m/20m and they also intend to participate in the CQWW SSB Contest while staying on American Samoa. This is their travelling schedule:

5W0AX	Samoa (OC-097)	Oct 17-22
KH8/ON5AX	US-Samoa	Oct 24-29
A35AX	Tonga	Nov 2-14
ZL/ON5AX	Neuseeland	Nov 16-Dec 14

INDIA, SPECIAL EVENT STATION

The special event station AT0MWG is working in CW/SSB/RTTY/PSK from the "4th Military World Games" (http://www.mwg2007.org) which are held in Mumbai until Oct 21. QSL via VU2SWS.

TURKEY, SPECIAL EVENT STATION

The Republic of Turkey is celebrating its 84th anniversary this year. For this reason TA2IJ is working as TC84IJ in CW/SSB until Oct 21. QSLs via TA2IJ.

GOLDEN JUBILEE OF THE JOTA

Following stations were announced to hit the bands during the upcoming JOTA event next weekend:

CT7EPO	QSL via CTEGW
HL9BSA	QSL via WX8C
HP1RCP	QSL via HP bureau
ON50JOTA	QSL via ON4GDV
PA50JOTA	QSL via PA3EFR

LINKS: Current SOTA activities (mountain summits) are announced at:
http://sotawatch.sota.org.uk/activations.php   or
http://sotawatch.sota.org.uk/spots.php

If you want to hear your QSOs mit CN2R with an audio clip you can perform a special logbook search at:
http://cn2r.net/cn2r/cn2log_interface/QSOs/Logbook.asp

UPCOMING CONTESTS

Oct 19-21: JOTA (http://www.scout.org/jota)
Oct 20/21: JARTS WW RTTY Contest
Oct 20/21: WAG Contest CW/SSB:

Please avoid the special contest free areas within the WAG Contest to eliminate any collisions with JOTA stations.

IOTA

collected by Fredy,DE0MST (e-mail: iota@dxhf.darc.de)

Island activities:

NA-088, HP4, Bocas del Toro Prov. Group: Tom,HP4/W4JKC, is a scientist and stays on Colon Island from Oct 12 until Nov 2. QSL via W4JKC.

NA-128, VE2, QC Province Group: A team of American and Canadian OPs will be active as VE3ZF/2 (CW/SSB) and W5GED/VE2 (RTTY/PSK) from Orleans Island from Oct 18-21.They will sign VE2IDX during the W/VE Islands QSO Party. QSL for VE2IDX via VE3ZF, all others via homecalls.

OC-005, VK9/N, Norfolk Island: Jack,HB9TL (VK6CTL), will be QRV as VK9CNF from Norfolk Island from Oct 19-25. QSL direct via HB9QR.

OC-164, VK6, Western Australia State South Group: Wally,VK6YS, and Bruce,KD6WW, are working as VK6YS/p from Rottnest Island until Oct 17. QSL via VK4AAR (d).

OC-several: Larry,N0UU, will NOT travel through the South Pacific like stated in the last DX Newsletter. Unfortunately this was a mistake.

Lighthouse activities (WLOTA/ARLHS)

YW6YL	LH 2062	VEN-030	Dec 12-16
CU8AS	LH 0947	AZO-015/016	resident
VK6YS/p	LH 2197		until Oct 17

So very true. For most hams that was the first one-on-one contact that they had with the FCC and being told that one passed the exam made it a positive contact. Some hams also went up to the FCC office to look up information in the public data bases or to ask for an interpretation of the Rules. Now one deals with the FCC via the very impersonal internet or through a third party (privatization at its worst) , and it's a good bet that most hams do not know the location of the closest FCC District Office or the name and face of the District Director or any of the field agents unless and until one receives an inspection or Notice of Inquiry or Violation because of some problem.

At one time the staff was encouraged to visit each ham club on a regular basis. Everyone knew who Phil Kane was and how he could be reached.

Those days are gone. What a loss.

That is not the only reason - part of the problem was that the very high brass had no idea why we were in the regulatory business in the first place. That culminated in the big decimation of the field staff in 1995-96 with the concomitant decline of the reputation and respect that the FCC had before then.

The "tax money" that was allegedly saved was poured down other holes that were created just because the position slots came available.

But you knew that....

Bwaahaaahaaa! I walked right into that one, Phil!

However, didn't the examiner have to use at least some judgement as to whether an applicant's Morse Code copy was 'legible', and whether his/her sending was OK?

Going back before my time, when the exams involved writing essays, drawing diagrams and showing how an answer was derived, didn't the examiner have some judgement as to whether the applicant had properly answered a question?

--

The way I recall it, the examiner I met wasn't so much trying to intimidate as to simply let you know that this licensing stuff was serious business.

--

One more story:

In those days (1967-1970) the written exam questions came in a booklet and there was a separate answer sheet for your answers. They made a big deal about having two #2 pencils, filling in the little box completely, erasing completely, not making stray marks on the paper, do not bend, fold, spindle or mutilate, etc.

I'd had similar standardized tests several times in school, and there was always an air of mystery about how the tests were graded. It was implied that they were fed into a computer that had a no tolerance for those who didn't follow instructions.

Being a curious sort, I asked how the machine worked, but got no information. Top secret?

It seemed to me there were two possibilities: either there was some form of photoelectric system that shone a light through the paper, or there was a grid of contacts (gold plated?) that detected the answers by the conductivity of the graphite pencil marks.

The photoelectric system seemed more workable, but the grid-of-contacts system explained the insistence on #2 pencils.

When I went to take the test at the FCC office, I thought I might get a glimpse of the grading machine. But there was nothing that looked like such a device in the exam room.

When I handed in my completed written test, the examiner's assistant pulled out what looked to me like a manila file folder. She opened it up and slid the answer sheet inside - behind a piece of paper with holes punched in it. She counted up the holes with marked boxes behind them, then pulled out the answer sheet and looked for any questions with more than one box filled in. Whole operation took very little time. She said "You passed" and that was it.

What a letdown! No fancy machine, no photocells or gold-plated contacts, no computer, just some pieces of paper with holes in the right spots.

I got the distinct impression that I'd seen something I wasn't supposed to reveal to others.

The phrase "pay no attention to the man behind the curtain" took on a whole new meaning that day.

The USA is just one of several dozen countries in Region II. Most of them have completely different national bandplans, and none of them correspond very closely with FCC mode-driven allocations. It would be pretty arrogant to suggest that all those other countries should bring their bandplans into line with Part 97.

Oh, it was a positive contact, all right. (I got to have two of them, both in the NYC office.) I remember more the FCC men who set my friend and I up with the headphones to listen to the 13 wpm tape. They were very nice to us teenagers. It's not to say that others, who got their tickets from VE's, don't have fond memories of *their* experiences. It's just that this was, well, the official place, #2 pencils and all that... ;-) And it was in a time (1963) when authority was respected a lot more than it is now.

Seriously, I attended a W5YI VE session here in Tucson about 14 years ago to take my Extra exams. It was in someone's house, and it was so noisy, they were having what amounted to a party while the exams were being given! I did pass the 20wpm (it was given in a separate room), but I failed the written.... in the party room. I was appalled at the "QRM" atmosphere. Give me the quiet, sterile FCC exam room anytime.

This kind of got me to thinking. Perhaps the judgement part is one of the reasons that essays went away. In a related situation, the first time I took my driving test, I went before a steely eyed Examiner, a state policeman by the name of Nix. I aced the written part of the test, and aced the driving test too. Then on the way back to the building where they were headquartered, he suddenly yelled out STOP NOW! I did so immediately, thinking there might be an emergency situation; after which he looked at me, grinned, and said "Congratulations, YOU flunked!" When I asked what I did wrong, He said "You didn't use your turn signal." My test was already over, and I did everything asked, and yet I couldn't do a thing about it.

I am a big supporter of the tests the way they are now.

Jim, October 14th is special for me, too. That's the date I entered active duty.

While serving, I had seven ranks, 10 PCS moves, including two unaccompanied short tours (12 months in 1979 and another 12 months in 1988), one long tour (1989), several deployments, lots of awards, and got to play radio, too.

In ham years, you're just getting dried behind your ears... Enjoy anther 20 or 30 or so...

> What do others remember?
>
> 73 de Jim, N2EY

I remember passing my novice test 20 years ago last November. In ham years, I'm a rank beginner..

> This kind of got me to thinking. Perhaps the judgement part is one of the reasons that essays went away.

I agree. Your story about the driving test shows how arbitrary that judgement could be. Things like handwriting legibility and how good someone is at English composition could make the difference.

Another issue is the need for examiners who knew the material well enough to grade the tests. Anybody with the right answer key can grade a multiple-choice test but essays require a grader that knows the stuff - and has the time.

Historically:

- Novice was always all multiple-choice.

- the pre-1953 Advanced had essays, diagrams, show-your-work problems and multiple choice. When it was revived in 1967, it was all multiple choice. (No Advanceds were issued from 1953 to 1967).

- Technician/General/Conditional and Extra had essays, diagrams, show-your-work problems and multiple choice until about 1961, when the old blue-book tests were replaced with all-multiple-choice tests.

There was not a single changeover date from blue-book to multiple choice exams, because the examiners were instructed to use up their existing stock of old exams before starting to use the new ones. So depending on where you went for the exam, you could get one or the other. I suspect that busy exam points like NYC used up their stock of old exams very quickly, while a less-busy place might have used them for quite a while after the new ones came out.

- For the first two years of their existence (1951-1953), Novice and Technician were tested at FCC offices unless the examinee could meet the "Conditional criteria" of distance or physical disability. After that time, those exams were issued by mail using a single volunteer examiner, regardless of distance.

>From what older amateurs have told me, the reason FCC made the switch was that the exam points were being inundated with people, particularly teenagers, coming to take the exams without adequate preparation. The tests were free in those days, and a kid on summer vacation could show up at the FCC office three times in a summer

with the 30 day wait. IMHO the FCC wanted to both reduce their workload of failed exams and reduce the number who passed simply because they'd gone back so many times that they'd seen all the exam versions.

The by-mail exam process slowed things down a lot because there was a 6-8 week processing delay at every step, plus all the work was at FCC Hq.

All the amateur radio written exams I took were multiple choice. None of them were difficult at all, IMHO. They did require knowing some radio theory and regulations governing the ARS, though.

>   I am a big supporter of the tests the way they are now.

Two things I would change in the exam *process* (not *content*, but *process*):

1) I would go back to the way things were in the late 1970s, when FCC conducted the exams, both in their offices and by request at hamfests, club meetings and almost anywhere that a certain minimum number of examinees could be guaranteed.

2) I would make the exams themselves 'secret', that is, no more open question pools.

Of course 2) would depend on 1). The chances of either actually happening are probably 'slim to none'.

They don't have to.

The point I was making is that the IARU Region 2 bandplan is supposed to be a plan for the entire Region. Yet it denies AM operation on all but two small slices of two bands, regardless of what FCC regulations or our national bandplan allows.

If I operate AM on 40 meters (say, 7290) during the daytime, is it bad amateur practice because it's contrary to the IARU bandplan? Or is it good amateur practice because it's in compliance with the ARRL bandplan?

It's one thing to say that AM operation (or any mode) should center around a certain frequency - that's what bandplans are all about.

It's a very different thing to say there is no room at all for AM on seven of the nine HF/MF amateur bands (60 isn't really a "band") even though it's allowed by FCC regulations on eight of those nine bands.

> It would be
> pretty arrogant to suggest that all those other countries
> should bring
> their bandplans into line with Part 97.

I'm not saying that at all.

What I'm saying is that national and regional bandplans should not contradict each other.

It would be a simple matter to add a note saying that where AM is permitted by national regulations, it should center its operation on certain frequencies.

And if it is "arrogant" to suggest that other countries bring their bandplans into line with Part 97, isn't it equally arrogant for other countries to declare the use of a popular mode by US amateurs to be bad amateur practice?

Or to put it simply:

Why isn't there any room for AM on 160, 40, 20, 17, 15 or 12 meters?

73 de Jim, N2EY

hardly the band plan should agree with our rules and our rules and the
rules of the ham s in all region 2 counties should be indentical if at
all possible esp wrt the HF and MF spectrum unless radio waves on
those bands are to suddenly start respecting national borders

In the mid 70's I took the first class phone exam in front of a FCC examiner
in Cincinnati.
Since there wasn't an FCC office in town they held the exam at a suburban
hotel in one of those meeting rooms where they pull out a divider to

subdivide the room. Unfortunately there was a Mary Kay Cosmetics meeting being held on the other side of the ballroom, and every five minutes or so Mary Kay ladies would start clapping and singing, just like camp meeting.

No "quiet, sterile FCC exam room " that day.

At least they tried, sort of.

My General class exam was held in the Federal Building in Knoxville, TN. I've seen other articles here that described using headphones for code exams; we did not have them. The room was one of those sterile 1960s government classroom/conference rooms, and the echo was horrendous. It was kind of like copying cw through QRN on 80 meters, which is just what I had been doing for the past few months, so I did pass the test. But I do wonder why headphones were provided for some exam locations, but not for others.

That was the main reason. The Commercial Radiotelegraph Operator
exams has diagrams to the end, and we always had to call an engineer
to grade those questions.

I took my General Test at the FCC Office in the OLD Federal Office
Building in Seattle, Washington, from the Steelie Eyed, Old Crone
named Gertrude Johnson, who was the Office Secratary. She did a
REAL Good impression of "Librarian from Hell". NO talking, no noise
of any kind, if your eyes even left your desk, you FAILED. She was
Code Proficent, clear up to 35WPM, and the EIC, Bob Deitch, was even
Better. I took my First Class Radiotelephone Exam in the same place
the next year, and Ms. Johnson was still there.
Years later, when I took the Advanced Exam, in the NEW Federal
Office Building, Bob Zinns was the examiner, and they just made you
erase all the memory in your calculator. I had it a lot easier
then, as I had been doing Marine Ship Inspections, with Inspectors
from the Seattle Office for a couple of years, and had a good
relationship whith all of them.
A few years after that, I was approched by the FCC Region X Director,
Bill Johnson, and was offered a position with the Commission as
a Resident Field Agent for Southeastern Alaska, attached to the
Anchorage Office. I spent 5 years working for them, untill the
ALGORE BloodLetting, that destroyed Field Operations as we knew
it.

I took my exam in Philly in the same era. Fortunately the headphones did
help
with the jack hammers going outside.

Actually they were processed at the License Center in Gettysburg, PA which still processes all licenses, inputting the data into the ULS and printing/mailing the actual document.

The success of (2) depends on the willingness to prosecute any and all
persons who reveal or possess the contents of any examination without
authorization. Does the name "Dick Bash" ring any bells? It's still
a sore point with me.

The chances of either actually happening range from "none" to "what
world are you on".

It all depended on what resources the local office could scrounge up, because the nickel-nursers at HQ were not of a mind to buy such things in an era when we had to scrounge surplus equipment from Federal disposal sites. Other agencies were "retiring" or discarding stuff that was newer and better than what we had in service. For many years our non-technical vehicles were the Fords and Chevys seized by the DEA from low-level drug dealers. The BMWs and Mercedes of the high-level dealers they kept for themselves.

The FCC was, and to some extent still is, a "pauper agency". They don't get to keep any of the license fees or spectrum auction proceeds collected, over and above the actual cost of processing the license or running the auction.

>Operations as we knew it.

That was the first time that I heard Internet Al blamed for it.

I had always thought that it was Der Hundt, when The Congress laid the task of rewriting the Cable TV rules on the agency but refused to approve any more slots (money) for the reg-writers. and he looked around to see who was expendable. He had no understanding of what the field did, no matter how hard we tried, and so the blood-letting of the field started. The then-Bureau chief (Beverly Baker, one of my law school mentors) resigned rather than go through with it. She was replaced by a former Chief Recruiting Sergeant for the Marine Corps.... (no further comment)

I took early-out 10 seconds after it was offered. That's how good morale was under that cloud 12 years ago.

You could get the same result, effectively, by increasing the size of the question pool. Just go from the present 8 or 10 to 1 ratio (pool size to test size) to something larger. It could be easily accomplished with the issuance of the next set of pools.

There's plenty of room; Part 97 rules allow AM operation on each of those bands.

Neither the ARRL or IARU bandplan has any legal standing beyond being two (of several) recommended ways of hams using their assigned spectrum. Since the bandplans serve two different populations sets, it isn't reasonable to expect that they'll be carbon copies of each other. If every country had exactly the same assigned bands, and those countries all micromanaged the ham spectrum like FCC does, then a unified and consistent IARU bandplan might be feasible as "law" to all those administrations. In the meantime, FCC isn't issuing any nasty letters for AM operation on any band where it's authorized, even if IARU hasn't blessed that operation.

And yet, it begs the question of *should* the tests be harder? And were they harder back in the day?

This is an oft contentious issue that I think it is possible that memory might be playing a sort of trick on people.

I have done a little research on the subject, imcluding "study guides" from the 1950's. I found the major difference was that the 1950s tests apparently contained more tube oriented material.

I was also struck by the fact that some of the questions are verbatim what they are now! Some of the electronic basics have not changed, and there are apparently only so many ways to ask the same question.

My references are for Novice and General, and I can say that the Novice written was very, very, easy. The General was of similar difficulty to today's General test. When I can get materials for the Advanced, and more importantly the Extra, I think I'll find a similar pattern.

My conclusions:

At least since the late 1950's, the testing was no more difficult than it is now. Many of the questions have changed, but in the context of the times it was quite similar.

Study guides were a substitute for question pools. Judging by the verbatim content of some of the questions to what is in the question pools, there must have been some relationship.

Perhaps one of the reasons that many people believe that the old time tests were so much more difficult is that at the time, they were for the test taker! Some yougster taking a General test back in 1957 would indeed find the test hard. After a few decades of college, practical learning, work, and experience, and a look at the new tests, one can be excused in thinking that they are "easy", because after all the knowledge accumulation, they are easy.

But not for everyone, and certainly the testing regimen should not be tailored to the highest denominator, so to speak.

Mike Coslo <mcoslo@youknow.comcast.net> wrote:

> And yet, it begs the question of *should* the tests be harder? And were they harder back in the day?

A frequently heard position is that the elimination of the code test should be counterbalanced by an increase in the difficulty and/or size of the written test. I suggested that back when there still was a code test, as a means of getting rid of the code test. At this point, I am ambivalent on the topic. Considering the shrinking population of hams, I'd like to keep the Technician test easy and advertise it as a foot in the door, especially to persons who are interested in ham radio mainly as a tool that is intended to serve other areas (emergency and disaster relief, for example).

> This is an oft contentious issue that I think it is possible that memory might be playing a sort of trick on people.
>
> I have done a little research on the subject, imcluding "study guides" from the 1950's. I found the major difference was that the 1950s tests apparently contained more tube oriented material.
>
> I was also struck by the fact that some of the questions are verbatim what they are now! Some of the electronic basics have not changed, and there are apparently only so many ways to ask the same question.

>
> My references are for Novice and General, and I can say that the Novice written was very, very, easy. The General was of similar difficulty to today's General test. When I can get materials for the Advanced, and more importantly the Extra, I think I'll find a similar pattern.

I don't doubt that, but the elimination of essays and diagram drawing questions has made the tests easier for some. Persons who can memorize the material can get grades that are out of all proportion to their knowledge of radio and electronics. Larger pools would change that.

> My conclusions:
>
> At least since the late 1950's, the testing was no more difficult than it is now. Many of the questions have changed, but in the context of the times it was quite similar.
>
> Study guides were a substitute for question pools. Judging by the verbatim content of some of the questions to what is in the question pools, there must have been some relationship.
>
> Perhaps one of the reasons that many people believe that the old time tests were so much more difficult is that at the time, they were for the test taker! Some yougster taking a General test back in 1957 would indeed find the test hard. After a few decades of college, practical learning, work, and experience, and a look at the new tests, one can be excused in thinking that they are "easy", because after all the knowledge accumulation, they are easy.
>
> But not for everyone, and certainly the testing regimen should not be tailored to the highest denominator, so to speak.

I found that to be true. In the late 1970's, I bought a copy of the Ameco study guide for the phone-one test (the thick book with an orange cover). I was unable to read it; I made absolutely no progress with it. Earlier this year, I used it to study for the GROL and found it quite easy. I wondered, at the time, whether that meant that I had become smarter.

On the other hand, some of those old study guides were clearly inadequate for the task. I have a copy of the "General Class Amateur License Handbook" by Howard S. Pyle, W7OE, Sams Publications [1961,1964,1968], 136 pages. You could MEMORIZE the entire book and still not come close to passing the test. It just glossed over the material.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group every month. You are now reading the first article, which explains what rec.radio.info is, and answers some Frequently Asked Questions. The second article is titled Posting Guidelines, and you only need to read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:

- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit chat about radio. Rec.radio.info will contain informational, factual articles only. Follow-ups are redirected to an appropriate other group, and further discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propagated across the net). This tag also facilitates a pre-existing method of dropping or canceling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:

```
/Newsgroups:.*[ ,]rec\.radio\.info/h:j
```

either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

```
rec.radio.info:!s/:^
```

in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:

```
sequence
rec.radio.info
rec.radio.
```

at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

More information about kill files may be obtained from Dave Fawthrop's Killfile FAQ at:

http://www.hyphenologist.co.uk/killfile/

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, we will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for discussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is the rec.radio.amateur.moderated Moderation Team. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@panix.com

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

rec-radio-info-request@panix.com

But before you do so, please be sure to check out the "Posting Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. We receive information in our mailbox; we then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would

be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, We would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. We reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all we can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

Google has an excellent web interface to Usenet newsgroups. It is available at:

http://groups.google.com

It supports both reading and posting.

Another excellent web interface to at least the radio-related Usenet |
newsgroups is the RadioBanter site: |

http://www.radiobanter.com |

sponsored by the NewsgroupBanter project: |

http://www.newsgroupbanter.com |

It, too, supports both reading and posting. |

-- Will the material appearing in rec.radio.info be archived somewhere? |

Yes. See Google Groups and RadioBanter above. |

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time

critical.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires co-operation and goodwill to be beneficial to the community in the rec.radio hierarchy.

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

*** rec.radio.info - Posting Guidelines and Etiquette ***

Two introductory articles about rec.radio.info are posted to this group and to rec.answers/news.answers every month. You are now reading the second article, which explains how to submit something to rec.radio.info, and which answers some Frequently Asked Questions about the submission process. The first article is titled "Welcome to rec.radio.info", and it might be a good idea to check it out as well.

-- How do I submit something to rec.radio.info?

Two possibilities. You can use your newsreading software to just post the article to rec.radio.info, as you would do with any other newsgroup. The difference is that the software recognizes the special status of rec.radio.info as a moderated group, and will e-mail your article to us, the moderation team, instead of posting it to the group.

Alternatively, you can mail your article directly to us at the following address:

rec-radio-info@panix.com

Mailing us directly is probably (a wee bit) faster, but using the transparency offered by the newsreading software is probably more convenient.

If you have any questions, or wish to deal with some administrivia with the moderation team, we suggest mailing to the following address:

rec-radio-info-request@panix.com

-- How soon will I see my article appear?

It depends on how busy we are. Your article reaches us as mail, we have to read it first, give it the stamp of approval, and finally send it on to the group. We will attempt to read and decide on all submissions within 72 hours at the very least, though we will probably be able to process submissions much faster in actual practice.

The site from which we moderate this newsgroup, "Public Access Internet and Unix, NYC" (Panix), is directly connected to the Internet, and articles posted at that site should appear at most major news sites, including Google Groups, the same day. The principal delay, therefore, will be the wait in the moderator's submission queue.

If you post a periodic article, and have shown to be trustworthy, we may allow you to post directly if the article is of a timely nature. See the section below on direct posting.

-- Should my article be in a specific format?

No. If it is not totally illegible, we will accept it, and if it does not have a correct subject-line we will correct it with your permission -- that's what a moderator is for.

However.

You could do us a big favor by making sure your article conforms to these simple requirements:

1) The article must present information, not discussion or requests, We will reject the article or require you to change the wording if it is worth it.
2) A good, descriptive Subject line.
3) Always mention what source you got the information from.
4) Don't forget to include a Followup-To header, at least if you don't want further discussion to automatically be forwarded to you, the poster, which is the default if the article is only posted to rec.radio.info.

As we said: if your article is appropriate we will post it even if you don't follow these guidelines, but then don't blame us for not processing it immediately. 'Perfect' articles we can send on with a couple of keystrokes. Stuff that needs minor editing is going to have to wait until we have time to do so.

Please do not waste both our and your time by posting requests, as this is an information only news group.

-- What about crossposting?

If you send something to rec.radio.info, just name any group you'd like to cross-post to in the Newsgroups field. Then, when we approve the article for rec.radio.info it will get automatically cross-posted to any other groups mentioned. This will also override the default Followup-To: poster, replacing it with the groups you cross posted to.

We would prefer if the group be cross-posted to the various discussion groups in the rec.radio.* hierarchy that are appropriate:

rec.radio.amateur.misc Amateur (ham) radio and related matters

rec.radio.amateur.packet Amateur Packet Radio discussions
rec.radio.amateur.policy Amateur Radio practices, rules, etc.
rec.radio.noncomm Non commercial radio discussions
rec.radio.shortwave International broadcasting on the 'HF' bands
rec.radio.cb Citizens Band (27 MHz) discussion
rec.radio.scanner Scanner discussions (unsupported group)

or in one of the moderated groups:

rec.radio.amateur.moderated Amateur radio practices, rules, etc.
rec.radio.broadcasting Discussion of *domestic* radio broadcasting

We will leave it up to the poster to decide which group(s) are appropriate, but reserve the right to add groups if we feel it has broader interest. We will consult with the poster first.

Notes on crossposting:

- rec.radio.broadcasting is also a moderated group. The rec.radio.broadcasting moderator prefers to review all articles himself before posting. Placing rec.radio.broadcasting before rec.radio.info on the Newsgroups line should accomplish this. We will typically abide by the rec.radio.broadcasting moderator's decision whether the article is appropriate for rec.radio.info.

- rec.radio.amateur.moderated is also a moderated group. As the rec.radio.amateur.moderated Moderation Team manages both rec.radio.amateur.moderated and rec.radio.info, we can manage crossposting and approvals for both newsgroups. The rec.radio.amateur.moderated group does not allow crossposting to other discussion newsgroups, whether moderated or unmoderated. However, we would like to manage rec.radio.info as consistently as possible with how it was done by previous moderators, including the grandfathering of existing regular postings. Therefore, the submitter can choose rec.radio.amateur.moderated or the other unmoderated rec.radio.amateur.* discussion newsgroups for crossposting, but not both.

- Any FAQ or informational posting approved by the rec.answers/news.answers moderation team that is also crossposted to any rec.radio.* newsgroup (besides just rec.radio.info) is also automatically pre-approved for rec.radio.info. See below for more information.

If you post to another moderated group, it may be better to make special arrangements with both moderators before posting by contacting us at our administrivia addresses.

In addition, cross-posts do not take up extra space; modern newsreaders can be configured to show you cross-posted articles only once anyway; not everybody reads rec.radio.info; and rec.radio.info was never meant to reduce the volume of the regular discussion newsgroups. But keep in mind that some of the mail gateways may filter out the informational

postings (at request of the subscribers) to keep the load down.

You decide.

-- I have a regular posting with timely information, can I make arrangements to help speed up delivery by posting directly from my site?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for rec.answers/news.answers. This requires cooperation and good will to be beneficial to the community in the rec.radio.* hierarchy.

If you are currently maintaining (or plan to maintain) a radio-related periodic information posting, you may wish to consider crossposting it to rec.answers/news.answers. Postings that are approved by the rec.answers/news.answers moderators for this treatment are automatically pre-approved for crossposting to rec.radio.info (as the news.answers requirements are far more rigorous than the requirements this newsgroup ever plans to use). For more information about this option, consult the appropriate information articles and posting guidelines in rec.answers/news.answers.

Realize also, that even if your post is not approved for rec.answers/news.answers, it can still be approved for rec.radio.info. The intention is not so much to get every last bit of radio-related information on rec.answers/news.answers, but rather to provide an alternative avenue of approval (as well as grandfather existing maintainers of radio-related information and spare them additional bureaucratic hurdles). Again, crossposting to either rec.radio.info or rec.answers/news.answers, both, or neither, is at the discretion of the poster (subject to the approval of the moderators). You decide what is most appropriate for your article.

Please remember that as an information maintainer, you are not alone. There are many others on the net who maintain and post periodic information postings, using various intermediate-to-advanced features of Usenet (usually via automated tools). Various degrees of technical support and general hand-holding are available from many Usenet veterans. Send us some E-mail describing your needs to our administrative address below, and we'll try to help, or at least refer you to the right knowledgeable individual(s).

-- And Follow-ups?

If the only newsgroup you have specified is rec.radio.info, then the

Followup-To: field will always be set to poster. If you do not want this, you must supply a Followup-To line of your own, and we will honor that one, as long as it is a subset of the original Newsgroups line.

If you specify newsgroups to cross-post to, then the Followup-To field will be set to include all the cross-posted groups, excepting rec.radio.info itself. Again, if you do not wish this behavior, supply your own Followup-To line.

We maintain other standards on the various RFC-1036 (news transport) header lines. For example, if the article is appropriate for passing into the Packet Radio Information Network, we encapsulate the Packet Bulletin Identifier (BID) in the Message-ID: news header line indicating the machine of origin as the ampr.org domain:

```
 Message-ID: <$opa.55.1994@ampr.org>                                        |
```

where the Packet Radio BID, in this example, is `$OPA.55', and it was posted in the year 1994, because some of the Bid numbers are cycled yearly. Hopefully, this can be used as a key to re-introduce the articles for the Packet Radio network. Also, if the article is a repost of an already existing information article in the rec.radio heirarchy, we ensure that the References: header line is linked to that previously posted article. This also helps to tag articles, and may be used for additional filtering if needed.

Since the articles are archived, please use the Summary and Keywords header lines to help one search for your article.

-- Why have I received no reply from you?

We never reject anything in silence, and we make a point of it to answer all our mail. However, E-mail, like a brain cell, can and does get lost, every now and again.

So, if you send us something, and you don't see it appear it rec.radio.info, and you still have not heard from us in reply after say, five days, you can be pretty sure that either your mail never reached us, or that our answer has never reached you. In that case, please try again (We will filter out duplicates).

Please direct any comments, questions, or criticisms about this article to rec-radio-info-request@panix.com.

(Adapted, with permission, from the original article written by Mark Salyzyn, AG4YD, ex-VE6MGS.)

Depends on what you mean by "harder".

I have License Manuals from 1948, 1951, 1954, 1962 and 1971.
There are more differences than just the tube emphasis.

For example, the old study guides focused on a few subjects in-depth,
and left other subjects completely alone. Lots of stuff on
power supplies, including rectifiers and filters, but almost nothing
on receivers, for example. Lots of calculations of how to know
you're in the band with a frequency meter or crystal with a certain
percentage error and a certain temperature characteristics, but
nothing on RF exposure. Etc.
>

Sure - there's only so many ways to ask for the unit of resistance.

The big thing is that the old study guides simply indicated the areas
that would be covered on the exams, not the exact Q&A nor the exact
method of the test. So some mental processing was essential.

> My references are for Novice and General, and I can say
> that the Novice
> written was very, very, easy.

I would say it was *basic*. It covered the regulations, some theory,
and that's about it.

Novice (back then) was also a one-year, nonrenewable, one-time license with extremely limited privileges. So its test could be very basic and still cover the needed material.

> The General was of similar difficulty to
> today's General test.

IMHO, it's not about difficulty but about covering the relevant material, and being sure the person being tested knows that material.

That's certainly true. In fact, the person to worry about is the experienced amateur who thinks the exams are "hard" even after gaining experience.

However, note that we cannot look at the actual exams of those days, because they aren't available. We can only extrapolate from the study guides. Today's tests are wide open. Big difference there!

The test-taker of those old days had no clear idea how the questions would be worded, nor how many would be on a given subject, so the usual response was to assume the worst and overprepare. Then the actual test seemed relatively simple.

At least that was my experience.

Some 20 years ago I had a job interview with the Regional Engineer, she
was crowing about the $100K budget plus-up he just got, I didn't have
the heart to tell him that I had a $100K pin money budget (as a minor
project lead for the DoD)

Xref: g2news2.google.com rec.radio.amateur.moderated:931

In a week I will begin teaching an entry-level class that the local radio club is offering. I would love any words of wisdom from experienced instructors of this material. I suspect that it has been at least a couple of decades since I last taught such a class, and things have changed a bit in that time <grin>.

The basic issue I'm wrestling with is walking the tightrope between teaching the actual questions from the pool and teaching concepts. It's not fair to the students to ignore the existence of the pool; after all, one of the goals of the class is to prepare them to take the written exam. But another goal is to get them ready to actually be an active member of the ham radio community, and memorizing pool questions doesn't contribute to that objective. So I'll try to do both -- cover concepts and review the actual questions.

Another issue is the scheduling of the class. There are proponents of the weekend method -- cover the material in a day or so. While there are advantages to that, I favor multiple shorter sessions. I think that learning is much better in that environment, but in today's hectic world, getting people to commit to multiple sessions is problematic. We've decided on six session spread over three weeks. Maybe that was a fatal error; time will tell.

I wish we still had something like the Novice license. I'd like to be able to get past the pressure of the written exam and get prospective hams some real experience so they understand what I'm babbling about in class. For example, you can lecture about repeaters, but if the students have actually *used* a repeater, they have a whole different understanding of what you're saying.

73, Steve KB9X

ALGORE was the guy who was incharge of the "Reinvention Of Government"
movement under the Clinton Administration. The Commission was one of
first agencies that got "ReInvented", and FOB was the first Bureau
that got slashed. It was interesting that the total number of employees
stayed fairly static thru the whole process..... $60K Engineers and
$45K Field Techs, replaced with $120K Economists, and $100K Lawyers....
and this saved money, How? Oh well, I really enjoyed my time with the
Commission, and the friends I made, and still have, some of whom are
still there. Although fewer, each year.

One year in the 1980s the annual budget for the FCC was less than DoD's expenditure for toilet paper. For enforcement budget and staffing shortfalls, we can thank JEdgar Hoover who made sure that enforcement activities of agencies other than his fiefdom were starved for funds. His legacy lives on.

A standard technique in college-level courses is to assign some readings that will not be discussed in class. Then, you give a test that covers the outside readings as well as the lecture content. You could use the question pool as outside reading material and then lecture about actual practice. Difficult questions from the pool could be covered at the end of class as an "extra help" session.

> I wish we still had something like the Novice license. I'd like to be able to get past the pressure of the written exam and get prospective hams some real experience so they understand what I'm babbling about in class. For example, you can lecture about repeaters, but if the students have actually *used* a repeater, they have a whole different understanding of what you're saying.

Keep in mind that the Element 2 written test used to be the written part of the Novice test. Arguably, it is easier to get a no-code Technician license than it was to get a Novice license. Please understand: I am not complaining. I think that is a good situation, especially if the intent is to draw newcomers into real-world communications, like disaster relief and not the self-limited exchange of beeps that the old Novice class was offered.

The ARRL license manuals do a pretty good job of explaining the material that goes into the questions. Also try to squeeze in some demos such as using the repeater. A few, but not too many, anecdotal experiences of your own can be productive too. Perhaps the first time you "let the smoke out" of a radio or tuner or whatever.

"Steve Bonine" <spb@pobox.com> wrote in message
news:13hpelos43h30b5@news.supernews.com...

> In a week I will begin teaching an entry-level class that the local radio club is offering. I would love any words of wisdom from experienced instructors of this material. I suspect that it has been at least a couple of decades since I last taught such a class, and things have changed a bit in that time <grin>.
>
> The basic issue I'm wrestling with is walking the tightrope between teaching the actual questions from the pool and teaching concepts. It's not fair to the students to ignore the existence of the pool; after all, one of the goals of the class is to prepare them to take the written exam. But another goal is to get them ready to actually be an active member of the ham radio community, and memorizing pool questions doesn't contribute to that objective. So I'll try to do both -- cover concepts and review the actual questions.
>
> Another issue is the scheduling of the class. There are proponents of the weekend method -- cover the material in a day or so. While there are advantages to that, I favor multiple shorter sessions. I think that learning is much better in that environment, but in today's hectic world, getting people to commit to multiple sessions is problematic. We've decided on six session spread over three weeks. Maybe that was a fatal error; time will tell.
>
> I wish we still had something like the Novice license. I'd like to be able to get past the pressure of the written exam and get prospective hams some real experience so they understand what I'm babbling about in class. For example, you can lecture about repeaters, but if the students have actually *used* a repeater, they have a whole different understanding of what you're saying.
>
> 73, Steve KB9X
>

Also keep in mind the new privileges that Technicians have regarding HF since the changes in Dec. 2006 and February 2007. Possibly print out the NEW band charts from the ARRL site and hand them out. You could give an HF operating demo for example.

This is an excellent idea *if* the info is readily available. Handouts are a good idea too, as are links to specific web pages.

Another thing I suggest is demos. Talking about repeaters is one thing, working somebody many miles away using a handheld is another.

But don't limit the demos to VHF or FM - just showing things like PSK31, CW, etc., are a good idea.

> > For example, you can lecture about repeaters, but if the

Hence the demos.

>

> be the written part of the Novice test.

I don't think that's true. Not anymore.

Before the 2000 restructuring, the written exams were these:

Element 2 - Novice
Element 3A - Technician
Element 3B - General
Element 4A - Advanced
Element 4B - Extra

Each element required its own element plus all lower elements.

As part of the 2000 restructuring, the elements were combined:

Old Elements 2 and 3A were combined and renamed new Element 2, used for Technician

Old Element 3B was renamed new Element 3 and used for General

Old Elements 4A and 4B were combined and renamed new Element 4.

> Arguably, it is easier to get a no-code
> Technician license than it was to get a Novice license.

Agreed - which sealed the fate of the Novice, by making Technician the de-facto entry license.

> Please
> understand: I am not complaining. I think that is a good situation,

> especially if the intent is to draw newcomers into real-world communications, like disaster relief and not the self-limited exchange of beeps that the old Novice class was offered.

I disagree!

The old Novice offered a lot more than "the self-limited exchange of beeps".

The old Novice wasn't meant as a permanent license class, but rather as a training ground towards the higher class licenses.

Yes, the privileges were limited, as was the license term. But what that did was to focus newcomers on a few bands and radio basics. It also reduced the cost of getting started.

Many Novices built their first stations, or part of them. This was practical because the limited priviliges meant that even a simple, low cost station was competitive with what other hams in the Novice subbands were using.

But those days were ended by the Tech becoming the entry point. Not many new hams can build an HT as a first project!

IMHO, the ideal 2007 entry-level license would offer a variety of bands and modes.

With all due respect, this is far from a college-level course. I have limited expectations that the attendees will spend vast amounts of time studying outside of class, and frankly I rather hope that that time will be spent taking practice exams. I think it's unrealistic to expect that if I "assign readings" anyone will actually read them.

> Then, you give a test that
> covers the outside readings as well as the lecture content. You could
> use the question pool as outside reading material and then lecture about
> actual practice. Difficult questions from the pool could be covered at
> the end of class as an "extra help" session.

This would be a fine strategy if my primary goal were to teach concepts, but my primary goal is to get these students a passing grade on the test. Sorry, but that's just the way that it is. I don't think it's appropriate for me to teach actual practice to people when they first need to pass their written exam.

What I would *like* to do is teach a followup class on what people need to know to get on the air -- how to select equipment, what actual antennas are like, operating procedures, and so on. But I simply cannot do that *and* teach them enough to pass the written test in the amount of time available. I consider my first priority getting them past the written test, then we can work from there.

I have to add, and I don't want to sound condescending, but I know that some of the people who will attend this class are barely literate, much less capable of reading and understanding the question pool . . . even though it's written at a junior-high level. This may be another challenge that I have -- how can I keep the intelligent people in the class interested when the dumber-than-a-rock crowd doesn't even understand the concept of what a frequency is?

> Keep in mind that the Element 2 written test used to be the written part of the Novice test.

Uh, no.

> Arguably, it is easier to get a no-code Technician license than it was to get a Novice license.

Different. Maybe easier, maybe not. Depends on how you learn and your educational background.

The written test for Novice was trivial. I had no problem with it when I was 13 years old. I also had no particular problem learning code when I was 13 years old, but the theory test for General class was quite intimidating. The Tech written is at least somewhat similar to the General back then.

> Please understand: I am not complaining. I think that is a good situation, especially if the intent is to draw newcomers into real-world communications, like disaster relief and not the self-limited exchange of beeps that the old Novice class was offered.

Sorry, but the the Novice class offered a lot more than "the self-limited exchange of beeps". It was a true entry-level license with incentive to upgrade. (You can't get much better incentive than the license going away in a year.) You got a real taste for ham radio and a real understanding of what the additional privileges you would earn really meant.

The Tech license is not an ideal entry-level license. It requires quite a bit of intimidating work to learn material that is pretty foreign to people who have no experience in radio. Once you've got the license you need someone to demonstrate the wonders of HF, else there is no incentive to upgrade.

What I'm looking for is a real entry-level license, similar to the Novice ticket, with an incentive to upgrade. I want to be able to actually teach concepts and the real skills that people need to get involved in ham radio, without feeling that I cannot do so because my limited time must be spent getting them the knowledge to correctly pick answers to pool questions.

But that's not likely to happen, so I'll do the best I can with what I have.

I actually have a bit of a problem explaining to potential Technician Class licensees that they have CW privileges on HF bands. It just seems either ironic or silly.

An HF demo is an excellent idea, but probably not possible as part of the actual class. Setting up an HF station at the classroom location would be an interesting challenge. (Might be fun, though.) Perhaps I will invite the class to visit me at home so I can do some HF work, or even schedule an extra session that's billed as a review session plus demo.

I prefer to explain things from the point of view that Technician is the entry-level license, then demonstrate HF and explain that it's available by passing additional written exams that are similar to what they're studying for now. My experience is that "CW" is a four-letter word. YMMV.

I do plan to do some demos as you suggested in your other article, including using a repeater, and maybe something related to EchoLink. This will depend a little on the background of the students, something I won't know until the first class.

Thanks for the suggestions.

I disagree!

The readings can be handouts of a few pages. Introductory stuff
with links to more advanced things.

Then you're essentially "teaching the test". And with all due respect,
that's a mistake IMHO. Here's why:

I think that we hams have sometimes placed too much emphasis
on getting lots of people licensed rather than educated and licensed.
The result is folks who are licensed amateurs but don't really know
how to get on the air. They're then left without the structure of a
class, to learn what's needed to actually use the license.

A recent statistic from ARRL said that 22% of new hams had *never*
gotten on the air with their new license. To me, that's a direct
indication of putting the license ahead of the knowledge needed to
use it.

Perhaps the handouts could cover the practical stuff.

If time is that limited, then IMHO its purpose is to guide rather
than to be comprehensive.

Who *are* these folks? I mean, the current written exams
have been passed by elementary school children years
away from middle school.

I suggest that if you have low expectations, the class will
live down to them, and if you have high expectations, they
will live up to them.

> This may be another challenge that I have -- how can I keep the intelligent people in the class interested when the dumber-than-a-rock crowd doesn't even understand the concept of what a frequency is?

With all due respect, if someone cannot grasp the concept of what a frequency is, they should not be a licensed radio amateur, IMHO. Such a lack of basic radio knowledge means the person just isn't qualified yet, and endangers both the person and those around them.

The whole point of license testing is to insure that licensees know the basics.

> The Tech license is not an ideal entry-level license.

Agreed. But it's what we've got.

> It requires quite a bit of intimidating work to learn material that is pretty foreign to people who have no experience in radio.

I disagree. It all depends on how the material is presented. To use the frequency example, while most people might not know a kilocycle from a bicycle, they will probably know that a piano produces different tones. A simple electronic keyboard can demo that principle easily. Then it's a short step to different radio frequencies.

Of course it must also be learned that there's a difference between sound as vibrating air and radio as a vibrating electromagnetic field, but that's part of the game.

> Once you've got the license you need someone to demonstrate the wonders of HF, else there is no incentive to upgrade.

Why not as part of the frequency demo? How about a long roll of paper with various frequencies on it - 60 Hz for power, the AM BC band, the 49 MHz baby-monitor band, VHF and UHF TV, FM BC band, cell phones, microwaves, and oh yes, the ham bands. Color code it for the various services.

> What I'm looking for is a real entry-level license, similar to the Novice ticket, with an incentive to upgrade. I want to be able to actually teach concepts and the real skills that people need to get involved in ham radio, without feeling that I cannot do so because > my limited time must be spent getting them the knowledge to correctly > pick answers to pool questions.

Then you need more time. It's that simple. The time can be class time, or it can be time the students spend reading and learning on their own. But it takes time to learn this stuff.

"If it were easy, everybody would do it."

> either ironic or silly.

I think it's neither.

The way I would present it is that the limited HF privileges of the
Technician are there if people want to use them. Amateur radio
is not all voice, particularly on HF, and the students need to know
that fact.

> An HF demo is an excellent idea, but probably not possible as

> would be an interesting challenge. (Might be fun,
> though.) Perhaps I
> will invite the class to visit me at home so I can do some HF work, >or
> even schedule an extra session that's billed as a review session
> plus demo.

Or put together a video of HF stations in action. That way you
can cover a lot of ground in a short time, and present a wide
variety of modes and equipment types. Ask around - there
are probably hams in your area who would demo everything
from CW to AM to satellites to PSK31 for a video.

> I prefer to explain things from the point of view that
> Technician is the
> entry-level license, then demonstrate HF and explain that it's
> available
> by passing additional written exams that are similar to what they're
> studying for now.

But that's not entirely accurate - and you shouldn't present
inaccuracies.

The HF privileges of Techs today are far more than what I got as a
Novice, yet I was more than willing to pass the tests just to get
those old Novice bands.

> My experience is that "CW" is a four-letter word. YMMV.

It's all about attitude. CW is a big part of amateur radio, and
should be presented. There's no test for it, but it's something
Techs are allowed to do.

The key (pun intended) is to present it as something positive
that can be learned if the person is interested.

If you act like it's hard, they'll think it's hard. If you act like
it's fun, they'll get that message too.
>
> I do plan to do some demos as you suggested in your other
> article,
> including using a repeater, and maybe something related to

> This will depend a little on the background of the students,
> something I
> won't know until the first class.

I suggest that you present a wide variety and let them pick
and choose. Do not assume too much.

For example, I see many hams assuming that young people
will be interested in modes that use computers (like WinLink)
but not in modes like CW and AM using older technologies.

Yet in my experience the reverse is often true. The uniqueness
of those older modes and methods is often what they find most
interesting. They're surrounded by computers, networks, etc. -
those things are everyday, "Radio" is special to them.

You have to give them the big picture and let them pick the pieces
they like.

Y'know, what I've found around here is that most new licensees (who didn't *have* to learn Morse) are interested in learning Morse.

(whether they'll actually take the time to do it is another question)

As long as one emphasizes it is not *required*, I think it would do more good than harm to at least mention CW as an option.

Believe it or not, in 1974 I took my General code test on the same
paper-tape code machine you saw the inspectors fussing with in 1956.

The pitch jumped briefly about halfway through. Didn't faze most of us,
but when the tape was over one of the guys being tested protested loudly &
insisted on being tested again. Don't know if he passed on the second try.

(the rest of us all passed on the first try, even with the jumping pitch)

By the time I took the 20wpm for the Extra two years later, they were
using a cheap portable cassette player. It worked, but most of the "soul"
was missing.

The train ride was from Milwaukee; I suspect the Federal Building was
somewhat taller; and there was a Sears Tower along the walk from the train
station, but I suspect it was a similar experience.

Why not teach the concept, and then *include* the pool questions
among other examples of practical application of the concept.
That would accomplish both while better tying them together.

Steve, I would say that a DEMO of anything that appeals to the senses is excellent, be it a whole station or just a handheld VHF-UHF, with, of course, a prearranged contact with a friend who knows that its a class demonstration.

Audio-visual presentations have worked for six decades in getting interest started and as a break in the formality of pure classroom environments. It is a basic principle of effective marketing. It gets the hook in the students to keep at it.

Yes, it is a lot more trouble to do, but even a short-and-snappy contact with a "shack on the belt" handheld will have an emotional appeal and break to the students. Quite probably most have already heard this elsewhere but, with prearrangement with another ham, it will be a solid contact. Even better, if the on-air conversation is done with the contact's knowledge, the back-and-forth will be more solid evidence of what can be done by Them later.

Everything should be aimed at the STUDENT. So far, I sense you have a feeling for them, a very good thing in my opinion.

The students are all looking at you in the class. You are their primary focus. The instructor has to be LOOKING and APPEARING relaxed and at-ease with the subject. You will have to appeal to their emotional senses to hold their interest. That's very subliminal but it is also an almost essential thing. It isn't acting. It is just a matter of remaining in contact with students, keeping their attention.

A lot of actual testing involves memorization of regulations, of the law itself. Memorization of such things is indespensible at any level of license class testing. It might be effective to have short periods of the class involving spotlighting just one part of that, get the class involved by having them do minor competition between themselves in front of the class on what you've just explained to them. That's a very old trick of many instructors, from public school on up to highly theoretical subjects. It can be good if presented in a friendly manner. It cannot be done effectively if it downplays the intelligence or emotional being of the different students.

Just a few words of friendly advice on your good volunteerism. I hope your classes do well and it is a success.

73, Len AF6AY

Hi,

Years ago, I had a list, now long lost, of "Fony Fonetics." It was a humorous phonetic alphabet of words which either were odd exceptions where the sound did not match the spelling, or were exotic and hard to distinguish over the air, such as using syzygy for "S" or Gemini for "G." I tried the usual Google route, and am wondering if anyone happens to have a list. I think the original may have been in one of the ham magazines.

I don't know if I found the one you had, but here's one from rec.humor.funny

The same old standard phonetic alphabet (which you would use to describe spelling "Wilson" as "Whiskey, India, Lima, Sierra, Oscar, November") has been used by aircraft pilots, millitary personnel, and many others for many years now. So, I finally decided to come up with something a bit more "original" for those people who annoy me:

A	Are	N	Nine
B	Bee	O	Owe
C	Cite	P	Pseudonym
D	Double-U	Q	Queue
E	Eye	R	Rap
F	Five	S	Sea
G	Genre	T	Tsunami
H	Hoe	U	Understand?
I	I	V	Vie
J	Junta	W	Why
K	Knot	X	Xylophone
L	Lye	Y	You
M	Me	Z	Zero

People don't ask me to spell anything over the phone anymore.

Steve,

It is too long ago to remember exactly, but those are all exactly the
type of thing I remember. Many thanks! I definitely need to head
over to rec.humor.funny as well.

==> SON OF FIRST HAM TO OPERATE IN SPACE TO FOLLOW IN FATHER'S FOOTSTEPS

Richard Garriott, KE5QNX, son of Owen Garriott, W5LFL, will be launching into space and living aboard the International Space Station in October 2008 as a client of Space Adventures. Owen Garriott operated the world's first Amateur Radio Station from space, W5LFL, as part of the Spacelab mission on the space shuttle Columbia (STS-9) in 1983; he is on the

Astronaut Advisory Board of Space Adventures. Space Adventures is a company that allows private citizens the chance for space travel on Russian Soyuz spacecraft at an estimated cost of $30-55 million per person. Richard, who is Space Adventures vice chairman, has applied for his grandfather's call sign, W5KWQ. He plans on making Amateur Radio on the International Space Station (ARISS) contacts when he is in space.

Richard will be the sixth private citizen to venture into space. According to his Web site <http://www.richardinspace.com>, his "main objective for his mission is to encourage commercial participation. By fostering the involvement of individuals, companies and organizations in his spaceflight Richard hopes to demonstrate that there is commercial potential in private space exploration, while furthering the understanding of space. Richard plans to demonstrate this by taking on various commercial projects, corporate sponsors for his mission activities and by helping companies market their products though their association with an actual space mission."

A self-described experienced terrestrial explorer -- "I have traveled to all seven continents on adventures that have included tracking mountain gorillas in Rwanda, canoeing down the Amazon, diving in a submarine to the Titanic and trekking Antarctica in search of meteorites" -- Richard says on his Web site that he is excited about his trip into space. "Journeying to space has been a dream of mine since I was young. So for me, space exploration was tangible, it was part of my family's DNA. But I was also acutely aware of the costs and complexity that kept it under the purview of the government. There was no imaginable way I was going to get a front-row seat like my father." Richard, 46, is the first American second-generation astronaut. In Russia, Sergey Volkov, 34, a pilot, is set to fly to the ISS as commander next spring. His father, Aleksandr, rocketed into orbit in the 1980s and early 1990s.

The first commercial research partner involved in Richard's space mission is ExtremoZyme, Inc, a biotechnology company co-founded by his father. According to his Web site, "Richard will operate an ExtremoZyme protein crystallization experiment loaded with proteins, many of which have important cellular functions and are often associated with common human diseases. Having access to these superior crystals will enable researchers to learn more about the molecular structure of these proteins, which is essential for protein engineering and drug design."

A well-known computer game developer, Richard, also known in the gaming world as Lord British, was the owner of now-defunct Origin Systems. The company is best known for gaming software such as the Ultima fantasy computer role-playing game series, Wing Commander and Crusader. Richard then founded Destination Games, which has since merged with NCsoft where he is an executive producer; his new game, Tabula Rasa, is set to be released by NCsoft later this month.

Rosalie White, K1STO, ARRL ARISS Program Manager, said, "With Richard's fame with the general public and Owen's fame in the science industry and with ham radio operators, Richard's planned ARISS educational activities should generate a great deal of interest for ham radio in all ages and types of people. This will be good for Amateur Radio and ARISS. The ARISS Team is really looking forward to supporting his ARISS school goals; we were so pleased to hear that he's already earned his ham license."

Richard lives in Austin, Texas. His home, Britannia Manor, has been featured on MTV. -- Thanks to Fred Maia, W5YI, for some information.

==> ARRL/TAPR CELEBRATE 26TH ANNUAL DIGITAL COMMUNICATIONS CONFERENCE

The ARRL and TAPR held their 26th Annual Digital Communications Conference this past weekend, September 28-30, in Hartford, Connecticut. The DCC is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees had the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results and practical applications.

With more than 150 in attendance during the three-day event, ARRL Chief Operating Officer Harold Kramer, WJ1B, said, "It was exciting to see and hear about the latest developments in Amateur Radio digital technology. The depth of knowledge, commitment and enthusiasm were very impressive and bode well for the future of Amateur Radio."

According to QST Editor Steve Ford, WB8IMY, many of Friday's seminars were devoted to the Automatic Position Reporting System (APRS). Bob Bruninga, WB4APR, gave the first session of the conference, "The APRS Local Voice Repeater Initiative." Bruninga is the developer of APRS.

Other seminars at the conference included "The Flex 5000 and Software Defined Radio Software," "HPSDR Update," "AMSAT's Phase IV," "A Method for Automatic Image Balancing in IQ Mixer Based Software Defined Receivers" and "Suit-Sat 2 Update." Ford also gave a standing-room-only seminar on an introduction to HF digital.

Ford said one of the highlights at the DCC was the NUE-PSK device. This gizmo makes it possible to do PSK31 without a PC. There is no word yet on when kits will be available for this item. "The latest Flexradio software-defined transceiver also drew a great deal of attention," Ford said. RPC Electronics debuted their all-in-one APRS tracker (2 meter transmitter, packet TNC and GPS receiver in one compact package). The company said it would be available for sale in December, just in time for holiday giving.

A popular feature of the DCC was the Demonstration Room. This was a place for participants to set up their projects for everyone to see, as well as a place for vendors to demonstrate their equipment.

ARRL New England Division Director Tom Frenaye, K1KI, spoke to conference participants Saturday morning, welcoming them to the DCC. TAPR held their annual meeting later that day.

The 2008 Digital Communications Conference will be in Chicago, but no date has been set. Check out the TAPR Web site <http://www.tapr.org> for more information.

==> ARRL AND MARS TEAM UP FOR WASHINGTON DEMO

The ARRL and Virginia radio amateurs associated with the Army Military Affiliate Radio System (MARS) put their emergency communications skills to the test on October 3, demonstrating to members of Congress and other Federal agencies how ham radio continues to work when other means of communications are disabled during hurricanes or other natural or man-made disasters. The demonstration took place in a compact portable communications center erected on the Capitol grounds near the Rayburn House Office. More than 50 MARS operators from Virginia, Maryland, West Virginia, Pennsylvania, Delaware and other states participated in the event.

According to the scenario issued by exercise planners, the event assumed a Category 3 hurricane named Quincy that deposited heavy rains over a multi-state area on October 2 and made landfall in the Delaware, Maryland and Virginia region later that day. The "storm" moved north into New Jersey and Pennsylvania, turned counterclockwise and traveled southward before returning to the Atlantic through the Carolinas and Georgia on October 5.

During the exercise, MARS operators also monitored other Amateur Radio emergency frequencies and coordinated the exchange of messages across their networks as well, honing their ability to work with other radio emergency providers such as the Amateur Radio Emergency Service (ARES).

ARRL Emergency Preparedness and Response Manager Dennis Dura, K2DCD; ARRL Chief Development Officer Mary Hobart, K1MMH, and ARRL Media and Public Relations Manager Allen Pitts, W1AGP, made the trek down to Washington. "As the unusually hot October sun fried us, despite the lack of sunspots," Pitts said, "representatives of ARRL, MARS and the Southern Baptist Disaster Response organizations fought poor propagation to make contacts through the day primarily on VHF, 20 and 40 meters. Dennis Dura worked the ARRL's HF rig most of the day as W1AW/3. Arkansas Congressman Mike Ross, WD5DVR -- one of only two Amateur Radio operators in Congress -- also made contacts from the site."

Pitts said that the ARRL team used the "When All Else Fails Banner" at the site. "We hoisted the banner in front of the Capitol dome. It attracted many vacationing hams in the area who stopped by to see what was happening, and some even were able to be brief 'guest operators.' But the day was mostly spent showing Amateur Radio capabilities to the Congressional staffers and others who work behind the scenes to make the wheels of government go. Janet Worthington, KB3PDS, of Chwat & Co -- the ARRL's lobbying firm -- was able to use the demonstration as a topic and drop off ARRL materials about HR 462 <http://thomas.loc.gov/cgi-bin/query/z?c110:H.R.462:> and Amateur Radio in every congressional office."

MARS operators used a variety of modes to move messages from the originator to the final recipient, depending on the operating conditions in place at the time. Operators used voice, CW and WinLink2000 to move messages. WinLink uses an e-mail-type interface, making it simpler for served agencies to send and receive their emergency traffic.

MARS volunteers are required to complete a variety of training courses to be a part of the program. They use personal radio equipment and are capable of operating on emergency power when conditions dictate. Many members are former servicemen and women who first learned radio communication skills while serving in the Army. MARS is a Department of Defense sponsored organization of Amateur Radio operators trained and equipped to provide emergency communications for military and government agencies when normal links are interrupted by accident, natural calamity or hostile action. W1AW recently received a MARS call sign - AAN1ARL. For additional information about Army MARS, visit their Web site at <http://www.netcom.army.mil/mars/>. -- Some information provided by Jeff Slusher, KE5APC/AAT3PD, Public Relations Manager for Virginia Army MARS.

==> LOOK FOR THE NOVEMBER ISSUE OF QST IN YOUR MAILBOX

The November issue of QST is jam-packed with all sorts of things today's Amateur Radio operator needs. From product reviews to experiments to contesting, the upcoming issue of QST has something for just about everyone.

This issue features an article by ARRL News Editor S. Khrystyne Keane, K1SFA, on the National Football League's Game Day Frequency Coordinator Program in her article "Football: Fumbles, Field Goals and Frequencies." Game Day Frequency Coordinators, many of whom are hams, are responsible for coordinating more than 300 frequencies for broadcast, referees, coaches and quarterbacks, as well as parking and security frequencies and more at each NFL game.

Did you miss the 2007 ARRL National Convention in Huntsville, Alabama? Catch up on all the activities with the ARRL Convention coverage in November's QST. The convention, held in conjunction with the Huntsville Hamfest and the Global Amateur Radio Emergency Communications Conference, drew more than 5000 people.

If you're in the market for a dual-band mobile transceiver, this is an issue you don't want to miss. Both the Kenwood TM-V71A Dual Band Mobile Radio and the ICOM IC-2820H Dual Band FM Transceiver are featured in November's Product Review.

ARRL Regulatory Branch Manager Dan Henderson, N1ND, explains how the FCC's recent actions affect you in his article, "The New Road Map to the FCC Rules."

Rich Roznoy, K1OF, wants to make sure you have the right kind of antenna for your car. You'll want to read his article, "A Comparison of HF Mobile Antenna Designs." If you need an easy-to-make Yagi antenna for your handheld transceiver, be sure to check out the article by Tom Hart, AD1B.

Get out your calendars and make sure you're on the air for the ARRL 160 Meter Contest, November 30-December 2, and the ARRL 10 Meter Contest, December 8-9. November QST has the official contest announcements and indicates just what you need to do to participate in these great operating events.

Look for your November issue of QST in your mailbox. QST is the official journal of ARRL, the national association for Amateur Radio. QST is just one of the many benefits of ARRL membership. To join or renew your ARRL membership, please see the ARRL Web page <http://www.arrl.org/join>.

==> NOMINATIONS NOW BEING ACCEPTED FOR THE 2007 ARRL INTERNATIONAL HUMANITARIAN AWARD

Nominations are open for the 2007 ARRL International Humanitarian Award <http://www.arrl.org/FandES/field/awards/humanitarian.html>. The award is conferred upon an amateur or amateurs who demonstrate devotion to human welfare, peace and international understanding through Amateur Radio. The League established the annual prize to recognize Amateur Radio operators who have used ham radio to provide extraordinary service to others in times of crisis or disaster.

The awards committee is now accepting nominations from Amateur Radio, governmental or other organizations that have benefited from extraordinary service rendered by an Amateur Radio operator or group. Nominations should include a summary of the nominee's actions that qualify the individual (or individuals) for this award, plus verifying statements from at least two people having first-hand knowledge of the events warranting the nomination. These statements may be from an official of a group (for example, the American Red Cross, The Salvation Army, a local or state emergency management official) that benefited from the nominee's particular Amateur Radio contribution. Nominations should include the names and addresses of all references.

All nominations and supporting materials for the 2007 ARRL International Humanitarian Award must be submitted in writing in English to ARRL International Humanitarian Award, 225 Main St, Newington, CT 06111 USA. Nomination submissions are due by December 31, 2007. In the event that no nominations are received, the committee itself may determine a recipient or decide to make no award. The winner of the ARRL International Humanitarian Award receives an engraved plaque and a profile in QST and other ARRL venues.

==> NASA TV SHOWS LAUNCH, DOCKING OF SPACECRAFT, MORE

If you have ever wanted to see what goes on when a spacecraft launches into space or docks with the International Space Station (ISS), be sure to check out NASA TV <http://www.nasa.gov/ntv> on your computer. You can watch live coverage of preparations for the launch, the launch and even the docking and hatch openings and closings as spacecraft arrive and leave the ISS.

NASA's Expedition 16 Commander Peggy Whitson, Soyuz Commander, Flight Engineer Yuri Malenchenko, RK3DUP, and Malaysian spaceflight participant Sheikh Muszaphar Shukor, 9W2MUS, are set to launch October 10 at 1321 UTC from the Baikonur Cosmodrome in Kazakhstan. Their Soyuz TMA-11 craft is planned to dock to the station on October 12 at 1427 UTC. Coverage for this event begins October 10 at 1230 UTC. Coverage of the Soyuz docking with the ISS, opening of Soyuz's hatch door and the post-docking news conference from Moscow begins October 12 at 1400 UTC.

NASA Flight Engineer Clay Anderson, KD5PLA, who has been on the station since June, will remain with Whitson and Malenchenko until the arrival of space shuttle Discovery on the STS-120 mission. NASA astronaut Dan Tani, KD5TXE, will arrive on that mission to replace Anderson, who will journey home on Discovery.

Expedition 15 Commander Fyodor Yurchikhin, RN3FI, Soyuz Commander and Flight Engineer Oleg Kotov and Shukor will return to Earth October 21 at 1032 UTC in their Soyuz TMA-10 spacecraft now docked to the ISS. Yurchikhin and Kotov have been aboard the station since April. Coverage for this event begins October 21 at 0345 UTC.

==>SOLAR UPDATE

Tad "Eleven Angels of Mercy Sighin' Over That Black Hole in the Sun" Cook, K7RA, this week reports: After 21 days of no sunspots, a sunspot reappeared, but only briefly. In fact, it was one sunspot, number 971, that emerged on September 28 for just a few days. Now we are back into a zero-sunspot period of indeterminate length, just four days so far. Solar wind provided geomagnetic disturbances, with September 29 being the most disturbed day. There was another rise in activity centered on October 3. Currently, the Air Force predicts a moderate rise in geomagnetic activity peaking October 20 with a planetary A index of 15, and a much larger rise to planetary A index of 25 on October 26. But spaceweather.com reports another solar wind stream to arrive on or around October 11. Geophysical Institute Prague predicts quiet conditions October 5-7, unsettled October 8, quiet to unsettled October 9, quiet October 10 and quiet to unsettled October 11. Sunspot numbers for September 27 through October 3 were 0, 15, 16, 17, 12, 0 and 0 with a mean of 8.6. The 10.7 cm flux was 67.1, 67.2, 67.6, 65, 67.7, 66.4, and 67.3 with a mean of 66.9. Estimated planetary A indices were 19, 21, 26, 12, 8, 9 and 18 with a mean of 16.1. Estimated mid-latitude A indices were 10, 15, 24, 11, 7, 5 and 9 with a mean of 11.6. . For more information concerning radio propagation, visit the ARRL Technical Information Service Propagation page <http://www.arrl.org/tis/info/propagation.html>. To read this week's Solar Report in its entirety, check out the W1AW Propagation Bulletin page <http://www.arrl.org/w1aw/prop/>.

==>IN BRIEF:

* This Weekend on the Radio: This weekend, look for the NCCC Sprint (CW) on October 5. On October 6, be sure to check out the TARA PSK Rumble Contest, the NCCC Sprint (CW), the International HELL-Contest (80 meters) and the EU Autumn Sprint (SSB). The Oceania DX Contest (SSB), the California QSO Party and the PRO CW Contest are October 6-7. Tune in for the International HELL-Contest (40 meters), the UBA ON Contest (6 meters) and the RSGB 21/28 MHz Contest on October 7. The YLRL Anniversary Party (SSB) is October 9-11 and the 10-10 International 10-10 Day Sprint and NAQCC Straight Key/Bug Sprint are both October 10. Next week, the ARRL School Club Roundup is October 15-19. The NCCC Sprint (CW) is October 12. The Microwave Fall Sprint, EU Autumn Sprint (CW) and FISTS Fall Sprint are October 13. The Makrothen RTTY Contest, Oceania DX Contest (CW) and Pennsylvania QSO Party are October 13-14. The North American Sprint (RTTY) and UBA ON Contest (SSB) are October 14. See the ARRL Contest Branch page <http://www.arrl.org/contests/>, the ARRL Contester's Rate Sheet <http://www.arrl.org/contests/rate-sheet/> and the WA7BNM Contest Calendar <http://www.hornucopia.com/contestcal/index.html> for more info.

* ARRL Continuing Education Course Registration: Registration remains open through Sunday, October 21 for these online courses beginning on Friday, November 2: Technician License Course (EC-010); Amateur Radio Emergency Communications Level 1 (EC-001); Radio Frequency Interference (EC-006); Antenna Design and Construction (EC-009); Analog Electronics (EC-012), and Digital Electronics (EC-013). To learn more, visit the CCE Course Listing page <http://www.arrl.org/cce/courses.html> or contact the Continuing Education Program Coordinator <cce@arrl.org>.

* ARRL Executive Committee Upholds Ethics and Elections Committee's Decision: The ARRL Executive Committee has completed its consideration of the appeal filed by Carl Gardenias, WU6D, of the decision of the ARRL Ethics and Elections Committee disqualifying him as a candidate for Director of the Southwestern Division. Based on its own independent review, the Executive Committee voted unanimously by teleconference to affirm the decision. This decision was communicated to Mr Gardenias on October 1, along with detailed findings of fact and conclusions of the committee. The Executive Committee is meeting this weekend and will release additional information after the meeting.

* James Michener, K9JM, Wins September QST Cover Plaque Award: The winner of the QST Cover Plaque Award for September is James Michener, K9JM, for his article "Maximum Gain Portable HF Yagi." Congratulations, James! The winner of the QST Cover Plaque award -- given to the author or authors of the best article in each issue -- is determined by a vote of ARRL members on the QST Cover Plaque Poll <http://www.arrl.org/members-only/qstvote.html> Web page. Cast a ballot for your favorite article in the October issue by Wednesday, October 31.

* Mark the "Play on PropNET" Weekend on Your Calendar: Play on PropNET is a two-day, worldwide event designed to promote PSK31 and propagation study on the 30 meter band. This event, scheduled for 0000 UTC October

6-2359 October 7, will be on 10.1395 MHz. Simply download PropNetPSK <http://www.propnet.org/>, a free PropNET software program, configure it for your station and activate for the weekend. PropNetPSK software will place the PSK stream at +1500 Hz (10.1410 MHz true). In normal operation, the software will cause your station to automatically ID at regular intervals (several times per hour) throughout the weekend. If your licensing authority requires that an operator be present whenever transmitting, switch to "Lurker" mode when you are away. This will allow your station to monitor and report anything that is heard, even if it isn't transmitting. PropNET uses the Internet as a reporting tool. Participants who are connected to the Internet (even using intermittent dial-up connections) will have their reports sent to a mapping system that will graphically display everything that is "caught" (a PropNET term for received). Transmitting stations will have their call signs shown on the map. Receive-only stations (Lurkers) will display using their 6-cipher grid-locator rather than call sign. Don't worry if you don't have an Internet connection at your station, as others will hear your transmission and report it to the Internet. As an added benefit, all stations that report activity will have their activity added to an animated GIF file at the end of each UTC day. All worldwide activity will be captured to that animation and will be able to be played back at a later time. All amateur and SWL stations worldwide are encouraged to participate for this first event of its kind. Thanks to the 30 Meter Digital Group for suggesting this activity and to the PropNET community of experimenters for supporting it. -- Ev Tupis, W2EV

* Notes from the ARRL DXCC Desk: ARRL DXCC Manager Bill Moore, NC1L, wants you to know that there is a feature on the DXCC Web site <http://www.arrl.org/awards/dxcc> that lets you verify that your DXCC application has been received, and when. Near the middle of the Web page, Moore says, is a link titled "List of DXCC Applications Received." Click on this link, and you will see applicants' call signs (listed alpha-numerically) and date the applications were logged into the DXCC computer. Note: this is not the date received from the post office -- it is the date the application was logged into the DXCC system. At the top of the page is a date. This date is always the Friday of the current estimated period DXCC is mailing applications. Due to the sheer volume of applications that pass through DXCC, applications before and even after this period may already be in progress. From this information, you can estimate the turnaround time of your application. Using today's date, look at the mailing date on the Web site. The difference between these two dates is the approximate turn-around time - if today's date is September 10, 2007 and the date shown on the Web page is June 29, 2007, the estimated turn-around time can be determined to be approximately three months.

* ARRL Shipping New Books: The ARRL is shipping three new ARRL publication editions: "The 2008 ARRL Handbook," "ARRL's HF Digital Handbook" and "ARRL's Low Power Communication." An early bird bonus CD is guaranteed for members and customers who place orders for The ARRL Handbook by October 31. You can find ordering details and more information at ARRL Online Product Catalog <http://www.arrl.org/shop>. These books are also available from ARRL publication dealers. Find the

dealer nearest you by going to the ARRL Dealer Locator Web page <http://www.arrl.org/catalog/dlrsearch.phtml>.

* Longtime ARRL Staffer Retires: Eileen Sapko, ARRL Awards Manager, retired September 28 after 23 years at League HQ. We wish her the best!If you have any questions concerning any of the ARRL awards programs, please direct them to Bill Moore, NC1L <bmoore@arrl.org>.

* Let Us Know What You Think: What's your favorite part of The ARRL Letter? What kind of stories would you like to see in the Letter? Would you prefer the Letter in an HTML format? This is your Letter and your chance to let your voice be heard. Please send your suggestions to ARRL News Editor S. Khrystyne Keane, K1SFA, at k1sfa@arrl.org, with the subject line "ARRL Letter Suggestions." All messages will be read and discussed, and we look forward to implementing positive suggestions into the ARRL Letter.

===

The ARRL Letter is published Fridays, 50 times each year, by the American Radio Relay League: ARRL--the National Association for Amateur Radio, 225 Main St, Newington, CT 06111; tel 860-594-0200; fax 860-594-0259; <http://www.arrl.org>. Joel Harrison, W5ZN, President.

The ARRL Letter offers a weekly e-mail digest of essential and general news of interest to active radio amateurs. Visit the ARRL Web site <http://www.arrl.org> for the latest Amateur Radio news and news updates. The ARRL Web site <http://www.arrl.org/> also offers informative features and columns. ARRL Audio News <http://www.arrl.org/arrlletter/audio/> is a weekly "ham radio newscast" compiled and edited from The ARRL Letter. It's also available as a podcast from our Web site.

Material from The ARRL Letter may be republished or reproduced in whole or in part in any form without additional permission. Credit must be given to The ARRL Letter/American Radio Relay League.

==>Delivery problems (ARRL member direct delivery only!): letter-dlvy@arrl.org
==>Editorial questions or comments: S. Khrystyne Keane, K1SFA, k1sfa@arrl.org

==>How to Get The ARRL Letter

The ARRL Letter is available to ARRL members free of charge directly from ARRL HQ. To subscribe, unsubscribe or change your address for e-mail delivery:
ARRL members first must register on the Members Only Web Site <http://www.arrl.org/members/>. You'll have an opportunity during registration to sign up for e-mail delivery of The ARRL Letter, W1AW bulletins, and other material. To change these selections--including

delivery of The ARRL Letter--registered members should click on the "Member Data Page" link (in the Members Only box). Click on "Modify membership data," check or uncheck the appropriate boxes and/or change your e-mail address if necessary. (Check "Temporarily disable all automatically sent email" to temporarily stop all e-mail deliveries.) Then, click on "Submit modification" to make selections effective. (NOTE: HQ staff members cannot change your e-mail delivery address. You must do this yourself via the Members Only Web Site.)

The ARRL Letter also is available to all, free of charge, from these sources:

* ARRLWeb <http://www.arrl.org/arrlletter/>. (NOTE: The ARRL Letter will be posted each Friday when it is distributed via e-mail.)

* The QTH.net listserver, thanks to volunteers from the Boston Amateur Radio Club: Visit Mailing Lists@QTH.Net <http://mailman.qth.net/mailman/listinfo/letter-list>. (NOTE: The ARRL cannot assist subscribers who receive The ARRL Letter via this listserver.)

This is WIANEWS for week commencing OCTOBER 7 2007

Richard VK3JFK and his crew are performing miracles with lots of hard work on the APRS front in VK3

VK3 APRS PATH CHANGE:-

Remember to change your Mobile Tracker or Kenwood radio�s due to the implementation of the APRS �New n-N Paradigm�.

Over time the old RELAY,WIDE and RELAY,WIDE2-2 paths will not longer work in Victoria. They will be replaced with the path of WIDE1-1,WIDE2-1 for mobiles and [your local digi],WIDE2-1 for home and fixed stations.

To implement the �New n-N Paradigm� all you need to do is edit the APRS path in your tracker, Kenwood radio or home station and change it to;

- WIDE1-1,WIDE2-1 for your mobile.

- [Your local Digi],Wide2-1 for your home station. (Replace [Your local Digi] with the closest digipeater to you)

In a few instances you may need to use the path of WIDE1-1,WIDE2-2 for mobiles.

For the recommended path in your area visit
http://vk3.aprs.net.au/packet_path_guide.htm

The following VK3 area Digipeaters only support the �New n-N Paradigm�;
VK3RCV-1, VK3RON-1, VK3RLV-1, VK2RBX-1.

VK3ROW-1 and VK3RMD-1 will be upgraded to support only the �New n-N Paradigm�

over the next few weeks.

IF you don�t change your path you may no longer be able to access the VK3 area APRS RF Network.

WICEN & APRS:-

WICEN is getting ready for the annual Rally of Melbourne Event (10th & 11th of November) which is held in the Healesville area each year.

This year more use of APRS is expected. You may have noticed a number of digipeaters with a W overlay on the icon on your map. These are the WICEN digis that being setup on 145.200Mhz for the Rally.

They will be used for Rally scoring as well as APRS.

During the Rally you should be able to watch the tracked vehicles from feeds on APRS-IS as the rally APRS data is being fed into an IGate. WICEN may use ACMA approved operational call signs for the event. Please do not use these digipeaters for general APRS traffic.

The second rally event to use APRS this year will be the Alpine Rally held on the 24th and 25th of November. This rally is held in the Bairnsdale area.

It will be using the APRS digipeaters VK3REB-1, VK3VHF-1 as well as 2 portable digipeaters. The event will operate on 145.175Mhz for scoring and Rally APRS traffic. During this time all non-local APRS traffic will be removed from the RF Network and local stations that are not involved in the event are requested to reframe from using APRS for the period of the event.

This event will also be fed to APRS-IS.

(Richard VK3JFK VK3 APRS Coordinator).

Richard VK2SKY says a US ham taking part in the World Solar Challenge hopes to be on 30m with APRS so we could follow his progress, www.findu.com
But he needs to borrow a rig, preferably from someone in VK5

The race is Oct 20 through Oct 27, Darwin to Adelaide.

Andrew, KE7ESD (atemme@gmail.com) says "To make it easier on getting/returning the equipment, we will have team members coming through Adelaide early this week. They will then be travelling up to Darwin. I will be arriving in Darwin
on the 16th".

p.s. I'm in the process of getting my Australian license right now!

Now KE7ESD's email address...

atemme@gmail.com

Australian D-Star News.

Things are hotting up in the Australian D-Star world.
Since NTAC allocated the segment in the band plan for D-Star operations there has been a lot of simplex activity in Melbourne particularly on 145.125Mhz.

D-Star simplex contacts have been reported from Box Hill to Murchison, a distance if approximately 150Kms. Both stations where using base station antennas however one station was using an ICOM IC-91AD hand held.

Amateurs seem to be embracing the D-STAR technology in a very enthusiastic way, in fact, one local ham outlet in Melbourne has been so busy, he is talking about taking holidays!!!

The Melbourne D-Star team are working hard to have the first Melbourne D-Star repeater VK3RWN online ASAP. The second D-Star repeater, VK3RMM will be operational before the end of the year. The VK3RMM analogue voice repeater will operate in parallel with the VK3RMM digital D-Star repeater.

On Friday night an informal talk was given to the Maryborough (Vic) Amateur Radio Club by Peter VK2TQ and Richard VK3JFK on D-Star.
At the same time in the Blue Mountains Henry, VK2OM was giving a D-Star talk to the member of the Blue Mountains Amateur Radio Club.

There are a number of new concepts to learn about DStar operations. It�s not the same as using an analogue repeater, yet it opens up a new range of options for operators such as DPRS, D-Star SMS and noise free international digital voice intercommunications through D-Star Gateways and the internet.

To assist operators to gain and share their knowledge, experience and local information on D-Star the WIA has set up a National D-Star email list. You can joint the National D-Star list by going to http://lists.wia.org.au/mailman/listinfo/dstar and fill out the details to subscribe.

A web site is being developed at www.dstar.org.au

The web site contains some basic information on D-Star and the Australian D-Star scene. The National D-Star web site is currently being built and will be on line soon.

HAMS ACROSS AUSTRALIA.

CENTRAL COAST AMATEUR RADIO FIELD DAY

On Sunday 17th February 2008 the Central Coast Amateur Radio Club Field Day will again be held at the Wyong Race Course. This is the most popular field day in Australia, generally drawing about two thousand interested amateurs and electronic hobbyists each year.

Major Australian radio and electronic equipment suppliers will be in attendance with displays of the latest radio and electronic equipment for sale.

Displays will also be provided by several amateur radio clubs and special interest groups and throughout the day an interesting lecture program will be provided.

The Newcastle Embroiders Guild will also be providing craft activities throughout the day which should be of great interest to the XYL�s.

The extensive car boot sale area will again be very active, providing a wide choice of goods for sale. As usual the free tea, coffee and chat area will operate but this time in a new bigger location. The various food outlets providing hot and cold sit down or take away food will also operate as usual.

As a new feature this year to promote further socialisation by those attending the field day, an Official Dinner will be held at the venue on the evening of Saturday 16th February 2008. This will be a buffet style meal with a guest speaker who will talk on an interesting radio relevant subject.

This Field Day provides the greatest opportunity for the amateur operator or electronic enthusiast to see and purchase all the latest gear in one location and meet up with a very wide range of like minded enthusiasts � a great opportunity to meet up with old friends and make new friends.

More details will soon appear on the Central Coast Amateur Radio Club�s web site www.ccarc.org.au.

How about you put it in your calendar as a must do event!

OCTOBER 27-28
The Wagga Amateur Radio Club is this year�s host for the Riverina Field Day.

The venue is again the clubhouse in Small St. The usual flea markets, Trade and other displays will run continuously in the hall from 9am on Sunday.

There will be a Field Day dinner to mark the opening and will be held at Clubrooms on the Saturday evening. It will take the form of a smorgasbord. Bookings are essential.

More Field Day information can be obtained from the club�s website http://wagga.radiocorner.net/

NEW VK7 ADVISORY COMMITTEE

David Potter VK7YUM � WIA Nominee
Clayton Reading VK7ZCR � REAST Nominee
Jason Reilly VK7ZJA - NTARC Nominee
Peter Rumble VK2IY/4KX � NWTARIG Nominee

In short the functions of the Advisory Committee as defined by the National WIA include:

Provision of advice and information to the board in relation to matters identified by the board;

Promote amateur radio, the WIA and membership;

Making available and encouraging others to make available local news for WIA broadcasts and releases; and,

Liaising with affiliated clubs.

EDUCATION YOUTH AND ADVANCEMENT OF AMATEUR RADIO PRESENTED BY KYLEA VK6FXYL

CLUBS TO ADMINISTER ZU EXAMS

The SARL is pleased to announce that the SARL has finalised the arrangement for affiliated clubs to offer the class B examination for their students. The new arrangement mean that Class B examinations can be conducted at ANY time of the year in addition to the South African national examinations held in May and October.

SARL PRESIDENT ADDRESSED FET TEACHERS

Graham Hartlett, ZS6GJH, addressed a group of teachers who attended a training course for Further Education and Training arranged by the Department of Communications. The objective of the course is to train teachers to take amateur radio into their colleges.

He cited amateur radio not just as a fun activity, but an activity that has a positive outcome on the further training of young people in the Science, Engineering and Technology disciplines.

Further Education and Training (FET) colleges strive to provide high-quality education and training to help learners equip themselves with the qualifications and skills needed to start out on a chosen career path.

"Amateur Radio can make a valuable contribution in this career choice and in addition teach basic technical and communication skills that will equip young people to render services to their community such as disaster communication and communication during large sporting events.

FUTURE EXAMS

To find out when a club in YOUR area is hosting assessments and/or training in Amateur Radio go to wia.org.au and check out the club pages.

Participating clubs keep this site up to date and post the latest information for all to see.

Also check the text edition of each news edition, where we do keep a secondary listing.

On the audio broadcast we will continue to give new information when it is received, but just in case you miss it one week, you can always access our text

Help amateur radio continue to grow

Do you know someone who could be interested in joining our hobby? Then encourage them to enrol in a Foundation Licence training course.

Next Foundation Licence course, and Standard / Advanced assessments .....

NEW SOUTH WALES

Summerland (Lismore), their next Foundation course/exam will be 10-11 November
If you know of any prospects, advise them of this date and let John VK2JWA or Duncan VK2DLR of their details.

www.tarc.org.au/tarcexam.htm

Tablelands Radio and Electronics Club
TREC WIA Exams Information
TREC will conduct exam sessions as required, at a time to suit the candidate. WIA Assessors and assessment packs are available for all 3 levels of licensing.
Contact the TREC WIA Exams Co-ordinator Dale VK4DMC on 4091 3700 or vk4dmc@wia.org.au for further information.

SOUTH AUSTRALIA

Adelaide Hills Amateur Radio Society will run Foundation licence's at the Aviation Museum, 56 Lipson Street Port Adelaide, November 3rd and 4th. Contact the course convenor, Sasi Nayar on 0417 858 547

Examinations are hosted by South Coast Amateur Radio Club. Those interested in sitting for foundation or license upgrades, please contact by email
vk5kbj@internode.on.net

TASMANIA

Radio and Electronics Association of Southern Tasmania

For more information or enrol please contact Reg Emmett VK7KK by emailing regemm@ozemail.com.au or calling 0417 391 607

And remember Foundation Licence Manuals and CD's are available for purchase at McCann's Model World in Elizabeth St. Hobart at $20.

A quick reminder about "Intro to the Standard Licence" sessions on a Saturday afternoons from 1:00 to 4:00pm in the Domain clubrooms.

These sessions are an introduction to the standard licences and attempt to de-mystify the upgrading process.
(Ken VK7DY/Reg, VK7KK)

INTERNATIONAL NEWS

Marconi Clifden Celebrations

On the 17th of October 1907 Guglielmo Marconi sent his first commercial message from the then new station at Clifden, Ireland. This October in celebration of this historic event members of the Galway Radio Experimenters Club will be running a special event station from Saturday 13th to Wednesday 17th from Clifden. The club has been issued the call sign EI100MFT for the event, MFT been the last call sign used on the original station.

On the Wednesday they will be making a special linkup with the Marconi sister station in Glace Bay, Nova Scotia. Part of this linkup will be an exchange of greetings between President Mary McAleese and Lieutenant Governor of Nova Scotia the Honourable Mayann E. Francis. The group will also be honoured to have Princess Electra Marconi present as she is visiting Clifden for the festival along with an Exhibit from the Marconi Foundation in Bologna. The Galway Radio Experimenters Club will also be presenting a display of vintage equipment.

More details on the festival can be found at www.clifden.ie. Visitors to the station are more than welcome and if you would like to participate this can also be arranged. For further information please contact Enda Broderick (II2II) on 086-8676410 or email: �enda dot Broderick at lightnet dot ie�.
{irts}

The first commercial transatlantic message was transmitted from Marconi�s Station in Clifden to his North American complex in Glace Bay, Nova Scotia almost 100 years ago. Marconi�s achievements will be celebrated with a series of Marconi Centenary commemorative events from October the 12th to the 17th in Clifden, coordinated by the Clifden Chamber of Commerce.

The celebrations include a lecture by Paul Duffy, Chartered Engineer and historian, entitled �Marconi-The Engineering Marvel�. This lecture will take place at the Clifden Station House Theatre on Sunday the 14th of October at 1 p.m. Michael Sexton, Chartered Engineer and author of �Marconi: The Irish Connection�, will give a lecture on the national aspect of Marconi�s work at the Clifden Station House Theatre on Monday the 15th of October at 1 p.m.

Professor Peter Kennedy will chair a forum entitled "Whither Wireless Communications? Marconi's Legacy in the 21st Century� on Tuesday the 16th of October at Clifden Station House Theatre. This forum will reflect on Marconi's achievements and the future for wireless communications in an era of ubiquitous connectivity.

NEWS FROM ARNEWSLINE

HAMS HELP NAB FLORIDA BURGLERS

3 Florida juveniles who allegedly used Amateur Radio gear to coordinate at least one burglary and possibly more have been taken into custody. This, after two they showed up on a wide area repeater that two hams were monitoring. One of them was a retired police officer.

It all started back on September 8th . Albert Moreschi, AG4BV, of Jupiter Farms and John Levey, KI4HTL, of Palm Beach Gardens, were listening to the repeater when some unexpected transmissions were heard. Some unlicensed operators showed up and what they were talking about caught KI4HTL's ear.

As a retired police officer, Levey, he knew what it was being discussed. So he began recording the radio transmissions from the suspects while he and Morsechi notified local law enforcement. Unfortunately, the would-be burglars didn�t describe the house well enough to get the exact address.

Then on September 21st the same group of bootleggers again showed up on the repeater. It was evident to Levey what was happening, so he again began recording the transmissions while coordinating with Morsechi by cell phone.

Meantime, the owner of the house being burglarized was huddled in her bedroom closet, calling sheriff�s deputies for help. They arrived on scene and the hams listening to the repeater knew it because the last transmission from the suspects was �Code Red, Code Red, Code Red. There are cops everywhere, dude!�

But for Levey, the work didn�t end with the suspects arrest. He then headed to the Jupiter Farms Sheriff�s Office substation where one of the suspects had been taken. KI4HTL identified himself as a former police officer and a ham radio operator. He told the deputy on duty that he had recordings of the suspects radio transmissions. The Sheriff�s Office is now in possession of the tapes.

Oh yes. We forgot to mention that the repeater that the suspects chose to use has coverage Boynton Beach to Port St. Lucie. That�s several hundred square miles. Its also a Citizens Emergency Response Team Repeater so there is always someone listening in.

==

RSGB NEWS G4NJH

The successful 3B7C DXpedition was extended for a day beyond its initial target. Operations were finally closed down at 0331z on Tuesday 25 September. The group managed a grand total of 135,718 QSOs, making it the third most-worked DXpedition of all time. Like 3B7C, the two most worked DXpeditions, D68C and 3B9C, were all operated by the Five Star DXers Association. Congratulations to all those involved.

The JOTA Story

A new publication has been announced to celebrate 50 years of Jamboree On The Air. The book is co-authored by Les Mitchell, G3BHK, Len Jarrett, VE3MYF and Richard Middelkoop, PA3BAR. A limited edition of The JOTA Story will be available shortly after the 50th JOTA on 20th and 21st October.

See http://home.tiscali.nl/worldscout/Jota/jota%20history.htm

OPERATIONAL NEWS -

October 6th to 7th
2007 Oceania DX Contest SSB

The EMDRC will be operating a portable station at Kurth�s Kiln, located near Gembrook.

The Oceania DX contest has been around for many years in early October and was known previously as the VK/ZL Contest. Activity has increased over the last three years due to a huge promotional effort by a joint Australian and New Zealand Committee.

PHONE: 0800 UTC Saturday 6 October to 0800 UTC Sunday 7 October 2007

The Parks web page for Kurth Kiln is
http://svc015.wic028p.server-web.com/1park_display.cfm?park=238
the friends group is
http://home.vicnet.net.au/~fofkk/

October 13th and 14th of October
Oceania DX CW contest.

This contest is for 24 hour and start 0800 UTC Saturday 14 October to 0800 UTC Sunday 15 October 2007.

Boat Anchor Sprints:
October (13).
Local ZL time: 2000 to 2100 hrs

Section 1: Old radios - all valves - i.e. ZC1, 19 set, Heathkits, any home brew set, but must have all valves.

Section 2: Any Hybrid transceiver (must have valve finals i.e. FT200, FTDX400/401, Drake, FT 101s, etc..

Amplitude Modulated signals only.

The overall winner shall be the entrant having the highest points score which will be published in the following New Zealand "Break-in".
(Jamie Pye ZL2NN, Editor NZART's InfoLine)

>From October 6 0000hrs UTC through 7 October 2359 UTC there is a world wide event promoting PSK31 and studying propogation on the 30 metre band..

The frequency being used 10.139.5Mhz USB

Sponsored by the amateur group PropNet the event will see a world wide net of automatic beacon like PSK31 stations which will periodically transmit ID statements.

Reception of these signals will be logged to produce a report on propagation... Details can be found on the PropNet Google group site.
The Group encourages listeners to report on reception of the signals...

Events such as this are widening the capability of amateur radio and the utilisation of the tools provided by PSK31.

Following on from PropNet, all Australian and New Zealand amateurs are invited to join together in the true Anzac spirit by participating in the first ever VK/ZL 30 Meter Digital Weekend, October 21.

This is not a contest but a casual affair promoting 30 meter Digital activity allowing those worldwide to work amateurs in VK/ZL and to see how well propagation really does work on this band.

So if you have some spare time over the 3rd weekend in October to hop on the band and work a few stations that would be great. It is lining up to be a exciting opportunity that may turn into a annual event.

When: Starting at 0500UTC on 21 October and Ending at 2000UTC 22 October

Where: 30 meter Band 10.135 to 10.145 MHZ

Modes: Mainly PSK31 BUT all digital modes welcomed including RTTY.

Objective: To make contact with VK/ZL Stations. This is not a contest but a casual event in promoting 30 meters Digital activity in conjunction
with the 30 meter PSK Group
www.groups.yahoo.com/group/30meterPSKGroup

Contact: Bill ZL3NB at zl3nb@xtra.co.nz

Please send all logs to zl3nb@xtra.co.nz or by snail mail to
174 Beach Road, North Beach, Christchurch New Zealand 8083

NOVEMBER 17/18 VK Spring VHF-UHF Field Day

John Martin reports that this is a week later than in past years. The change of dates avoids clashes with some club activities that will taking place earlier in the month.

There are two minor changes in the rules:

1. Stations may enter both the 24 hour and 8 hour sections, but only if the station actually operates for more than 8 hours.
2. Changing locations: It is not in the spirit of the contest for grid-hoppers to set up more than one station and move between them. The rules now make it clear that not only the operator but also the station must be moved when operating locations are changed.

The full details are on www.wia.org.au

NOW ROBERT BROOMHEAD - VK3KRB.

Sputnik 1 � a world first

Confirmation that the Soviet Union had launched the first man-made earth orbiting satellite came with a radio signal that was heard half a century ago last Thursday, October the 4th.

Around the world amateur radio enthusiasts picked up the satellite�s beacon signal on a frequency of 20.007MHz.

A number of radio amateurs had their five minutes of fame through media reports of their claims of hearing the satellite.

Its history making orbit of earth had a permanent impact on many of today�s baby-boomers, whose interest in space and technology was awakened by Sputnik 1,
the true beginning of man�s space exploration.

Now let�s listen to how Sputnik 1�s weak signal was heard in October 1957 as it orbited once every 96 minutes.

(audio file sputnik1)

We acknowledge the National Aeronautical and Space Administration for that audio, first reported in Australia, according to the Mercury newspaper, by VK7YY, OIC, Hobart Radio.

The same edition of the Mercury published pictures of Len Edwards VK7LE and Crosby Welch VK7CW receiving Sputnik 1 transmissions. It was claimed that: "Hundreds of the State's hams tuned into the Red satellite".

Transmissions were on 20.005 MHz. & 40.002 MHz. and received at good volume.

The professor of physics at Sydney University said ; " the launching of the Soviet space satellite "means life or death for us� freedom or the extinction of civilisation"".

That same weekend the Australian Government had planned detonation of an air blast nuclear bomb at Maralinga.

Those were interesting times����� and that information is from the REAST Historian also Jim Linton VK3PC

One day shy of a month after Sputnik 1 made history as the world's first man-made satellite, the Soviet Union launched Sputnik 2. This time, in addition to radio transmitters like that of its predecessor, the satellite carried the first animal into orbit, a dog named Laika

The club is already expecting 120 visitors over the weekend, please keep a listen out for the call sign, VK4SMB, that's VK4, Scouts MurrenBong.

BB's DIARY ROOM - THE FUTURE, IN AMATEUR RADIO

SOCIAL SCENE

OCTOBER 6
Gold Coast Amateur Radio Society Annual Hamfest at Albert Waterways Hall.

October 14
Annual inter-club BBQ in central Victoria.

Members of the Central Goldfields Amateur Radio Club of Maryborough, Midland Amateur Club from Bendigo, the Ballarat Amateur Radio Group and Amateur Radio Victoria will attend this event at Laanacoorie next month.

Organiser Peter Rafferty VK3CC explains that it's a BYO meat and drinks affair, with bread, butter, tea, coffee provided.

Apart from being a really great social occasion, last year's BBQ resulted in the cooperative venture - the Centre Victoria RadioFest at Kyneton.

The BBQ will be at the Laanacoorie Hall, the date Sunday the 14th of October starting at 10am.

Laanacoorie is on the Loddon River on the Eddington side of Bendigo about one third of the way between Maryborough and Bendigo.

OCTOBER 27-28
The Wagga Amateur Radio Club is this year�s host for the Riverina Field Day.

The Field Day is being held on the 27th and 28th of October. So please pencil the date into your calendar.

The venue is again the clubhouse in Small St. The usual flea markets, Trade and other displays will run continuously in the hall from 9am on Sunday.

There will be a Field Day dinner to mark the opening and will be held at Clubrooms on the Saturday evening. It will take the form of a smorgasbord. Bookings are essential.

More Field Day information can be obtained from the club�s website
http://wagga.radiocorner.net/

Wagga Wagga is the largest inland city in NSW and is well situated halfway between Sydney and Melbourne. These days it is a very leisurely 4 and a half hour drive from Sydney�s outskirts with the majority of the trip on dual lane highway. So why not plan a getaway and join us for the weekend.

For more information contact John VK2YW on 02 6926 5471 AH or
vk2yw@wia.org.au

NOVEMBER 4
The Ballarat Hamvention at the Great Southern Woolshed located on the Western Highway on the Melbourne Side of Ballarat. General entry for $6:00 is from 10am. details at the BARG website
www.barg.org.au

NOVEMBER 5
The Gladstone Amateur Radio Club will hold its annual beach BBQ at Millennium Esplanade, Tannum Sands 12:00 midday. There will be a mystery auction and games as well as a few refreshing drinks in the shady picnic area by the beach.

For out-of-towners, just put in a call on 146.500 MHz or the repeater on 146.625 MHz for direction, or look for the clubs distinctive mud-crab banner.
RSVP if you like via gladstone_ar_club@yahoo.com.au

JANUARY 20 2008

The Mid North Coast Amateur Radio Group invite all amateurs to attend the 2008 Mid North Coast Radio Expo to be held in Coffs Harbour on Sunday 20th January.

The Expo is held at the St Johns Church Hall, Mc Lean Street, Coffs Harbour.
Gary VK2ZKT is the Radio Expo Coordinator on 02 66 55 2 990 or visit the Groups comprehensive web site at www.mncarg.org

FEBRUARY 10

Announcing Centre Victoria RadioFest No. 2.
Second-hand traders, club corner, short-talk lectures, displays and the popular dipole factory will all return, plus some new exciting activities to be announced later.
All major commercial traders have already made commitments to be there again

in 2008.
For second hand table bookings that cost only $12.50 please contact Nick Angelo VK3UCK 0488 653 201, or check out the website radiofest.amateurradio.com.au

FEBRUARY 17

CENTRAL COAST AMATEUR RADIO FIELD DAY

On Sunday 17th February 2008 the Central Coast Amateur Radio Club Field Day will again be held at the Wyong Race Course. This is the most popular field day in Australia, generally drawing about two thousand interested amateurs and electronic hobbyists each year.

Major Australian radio and electronic equipment suppliers will be in attendance with displays of the latest radio and electronic equipment for sale.

Displays will also be provided by several amateur radio clubs and special interest groups and throughout the day an interesting lecture program will be provided.

The Newcastle Embroiders Guild will also be providing craft activities throughout the day which should be of great interest to the XYL�s.

The extensive car boot sale area will again be very active, providing a wide choice of goods for sale. As usual the free tea, coffee and chat area will operate but this time in a new bigger location. The various food outlets providing hot and cold sit down or take away food will also operate as usual.

As a new feature this year to promote further socialisation by those attending the field day, an Official Dinner will be held at the venue on the evening of Saturday 16th February 2008. This will be a buffet style meal with a guest speaker who will talk on an interesting radio relevant subject.

This Field Day provides the greatest opportunity for the amateur operator or electronic enthusiast to see and purchase all the latest gear in one location and meet up with a very wide range of like minded enthusiasts � a great opportunity to meet up with old friends and make new friends.

More details will soon appear on the Central Coast Amateur Radio Club�s web site www.ccarc.org.au.

How about you put it in your calendar as a must do event!

SOUTH AFRICAN RADIO LEAGUE

SARL NEWS SUNDAY 07 OCTOBER 2007

You are listening to ZS6SRL the official Radio Station of the South African Radio League, the National Body for Amateur Radio in South Africa, with a news bulletin that is transmitted every Sunday at 08:15 CAT in Afrikaans and at 08:30 CAT in English. To listen to a web stream or Echolink by ZS6FCS visit www.sarl.org.za, click on ARMI and follow the links for details.

This, and previous bulletins, can be downloaded from the www.sarl.org.za. You can also read or download previous bulletins from there and subscribe to receive future bulletins by email.

Your news reader this morning is Hans, ZS6KR, on 145,725 and 7,066 MHz from Pretoria with relays on 3,695, 10,135, and 51,400 MHz as well as 438,825 and 1 297 MHz in the Pretoria area. (Other newsreaders please change to suit).

SILENT KEYS

The Pretoria Amateur Radio Club regrets to announce that Don Blackburn, ZS6CRT, became a silent key on Tuesday after a valiant battle with cancer. Don was a past chairman of the club.

Our sincere condolences to his wife Sue, ZS6SUE, and his children Jonathan ZR6JON and Samantha.

The key of Peter Finlay, ZS5ADN, became silent on 23 September after a long illness. To his family and friends, our sincerest condolences.

Sharief Osman, ZS1SSB, affectionately known as Ozzy, passed away at the age of 42 on the 22 September 2007. our sincerest condolences to his wife Amina, 3 young children, other relatives and friends.

(PAUSE)

In the news today:

2008 SARL NATIONAL CONVENTION - A FEAST OF AMATEUR RADIO

INTECNET AND PRESIDENT'S NET TONIGHT

EXPANSION OF 40 METRE BAND

DRAFT POWERLINE REGULATION PROCESS CONTINUES

You are listening to ZS6SRL. Stay tuned for more detail on these and other important and interesting news items.

2008 SARL NATIONAL CONVENTION - A FEAST OF AMATEUR RADIO

The SARL National convention will be held in Bloemfontein from 11 to 13 April 2008 and promises to be a weekend of amateur radio activity South Africa has not seen for many years. The weekend will be hosted by the Bloemfontein Amateur Radio Club and will include a visit to the Boyden Observatory on the Friday evening. The Annual General Meeting will be held on the Saturday morning followed by an ARDF demonstration Hunt and various technical session covering HF, VHF and Hamnet.

Visits to the Leeuwberg museum and Onse Rust will be arranged with the Gala Awards Dinner at the Commando Restaurant. The weekend will be concluded with breakfast with a view at the ZS9X Contest station on Sunday morning.

The organising committee is working with SA Airlink to provide special travel and accommodation packages. Diarise the date now and stay tuned. Information will be available on the web soon.

INTECNET AND PRESIDENT'S NET TONIGHT

The President's net will be held this evening, 7 October, starting at

19:00 and will be followed by the Intecnet.

SARL President, Graham Hartlett, will talk about plans for the 2008 AGM and nominations for Council which are due soon. He will also discuss the procedure for affiliated clubs to offer the class B examination for their students. The full examination procedure and the necessary application forms will be available on the member pages of the web after his presentation.

The Intecnet will feature a discussion on the HMO/SARL 40 metre beacon programme led by Dr Lee-Anne McKinnell of the HMO. John Willescroft, ZS6EF, who is constructing the beacon equipment will discuss the design and operational issues. A PowerPoint presentation is available on the web at www.sarl.org.za, click on ARMI.

Clubs wishing to link their repeaters should send details of the telephone number to armi@sarl.org.za by noon today.

EXPANSION OF 40 METRE BAND

The SARL receives regular questions from amateurs about the expansion of the 40 metre band. The issue is on the top of the Agenda in our interaction with ICASA. There are however several problems to be overcome. One is that South Africa's signal distributor, Sentech, is still using that segment and will have to relocate to higher in the band. The SARL is in discussion with Sentech. In terms of the ITU agreement they have the right to continue using the spectrum till 2009.

HAVE YOU PAID YOUR SUBSCRIPTION?

Invoices were mailed in June, with follow-up reminders in August and September. If you have not yet renewed your membership, please do it as soon as possible. Members who have not remitted their dues by the end of October will no longer receive Radio ZS or have access to the member-only section of the SARL web. Your membership is important for Amateur Radio; it is our collective voice through the SARL, the national Body for Amateur Radio, which needs to be strong and representative. Your membership makes that difference. If you are not a member yet, it is never too late to join. Application forms are available on www.sarl.org.za.

DRAFT POWERLINE REGULATION PROCESS CONTINUES

At the SABS TC80 meeting on Thursday ICASA informed the committee that the draft regulations for PLT, Power Line Telecommunications, will be tabled for discussion at the Standards Liaison Committee this coming Thursday. The SARL was part of the drafting of the interim regulations and made several demands that for example all amateur HF bands are permanently notched. The SARL's position was noted but in the final draft to be discussed by the SLC no notching was included. Positive aspects of the draft regulations are the inclusion of an interference mitigation process and the requirement that a public accessible data base of PLT installations be maintained. PLT vendors must also give notice of planned installations.

The SARL made further representation to ICASA that International experience has shown that interference standards based on FCC limits are inadequate and will lead to unnecessary mitigation processes. A recent report from the ARRL laboratory pointing out the inadequacy of the FCC standards was also submitted.

At the TC80 meeting several additional problems were highlighted which will be discussed by the Chairman of the TC80 workgroup on EMC at the SLC meeting which he has been invited to attend.

After the final draft is agreed at the SLC, the draft regulations will be published in the Government Gazette for comment. The SARL is preparing its comment based on current known aspects of the draft regulation and will fine tune its objections once the final draft has been published. It is expected that the SARL will also attend public hearings.

AMATEUR RADIO DIRECTION FINDING - SARL RECOMMENDS THE 80 m APPROACH FOR NOW

At last week's Council meeting the future participation of South Africa in the ARDF - Amateur Radio Direction Finding competitions held annually by the IARU in Europe was discussed. On recommendation of the IARU ARDF committee chairman, Reinhardt Floesser, it was decided to first tackle ARDF on 80 metres. The reason for this is that on 2 metres too many reflections occur which for the newcomer presents problems in a multi transmitter competition which is the IARU standard. Later on 2 m ARDF will be added. The international competitions are presented in two categories, HF and VHF.

The SARL is studying the various circuits and kits available and would welcome input from clubs and individuals. Please send your comments to zs4bs@netactive.co.za. An Intecnet with Rhynhardt Floesser is being planned for 25 November.

JOTA AND JOTI 20 TO 21 OCTOBER

Dave Gemmell, ZS6AAW, SA National JOTA Co-ordinator makes it known that Jamboree-on-the-Air, JOTA, and Jamboree-on-the-Internet, JOTI, will take place on 20 and 21 October.

Many thanks to Evan Davies, ZS6EVD, Eddie Leighton, ZS6BNE, and Lichtenburg ARC who planned, and will be operating as, ZS50MAF, in Mafikeng.

This year's is the 50th JOTA and 11th JOTI and it's not too late to arrange a JOTA station which can be put together in an hour or two!

If you had not been approached by scouts, invite them for a day or week-end to do experiments with antennas and contact local and overseas JOTA stations. Introduce them to different modes such as , CW, RTTY PSK

31, ECHOLINK, Skype, etc. from your club house, home or where ever.

Remember, register your station as an educational station with the SARL at least 7 days before the main event so that your unlicenced guests may also use your transmitting equipment under your guidance and derive maximum enjoyment from the event. Forms for this purpose are available on www.sarl.org

More international info. can be found on www.jota.org or www.jotajoti.org

SPRING QRP SPRINT RESULTS

Nine logs were received for the Spring QRP Sprint held on Sunday 9 September, 4 in the 5 watt class and 5 in the 1 watt class. The results are as follows

5 Watts: 1st Vidi, ZS1EL 2 992 points; 2nd Ruaan, ZS6RMS 1 600 points; 3rd Oakdale ARC, ZS1OAK 1 540 points; 4th Allen, ZR1AAH 864 points.

1 Watt: 1st Jan, ZS4JAN 15 120 points; 2nd Andre, ZS2ACP 12 960 points; 3rd Pam, ZS6APT 3 960 points; 4th Pierre, ZS6BQS 2 520 points; 5th Franz, ZS6EU 640 points.

Congratulations to the winners.

PROPAGATION REPORT

Hannes Coetzee, ZS6BZP, reports that the expected solar activity will be at very low levels. The geomagnetic field is expected to be quiet in general increasing to unsettled levels on 17 till 19 October. The expected Effective Sun Spot number for the coming week will be less than 5. Fortunately with the arrival of summer DX conditions are also warming up a bit.

15 m and 20 m will provide best opportunities for DX. There is a possibility of 15 and 20 m openings towards India from about 10:00 CAT. There may be 20 m openings to Australia from about 06:00. From 16:00 there may be 15 and 20 m openings towards Europe. From 18:00 there may be 15 and 80 m openings towards the USA.

For the CW and digital enthusiasts it will also be worth monitoring 10 MHz.

Locally conditions on 40 m is going to be good during the day and even 30 m may perform well over the longer distances.

It is once again time to work towards your 80 m WAZS award in the evenings. Remember that this is only a prediction and that HF always has the capability to surprise you. You will never know what you are missing unless you switch your rig on, listen and also call CQ.

Please visit www.spaceweather.co.za for further information.

DIARY OF EVENTS

7 October, tonight - President's Net and Intechnet; 18 October - Class A RAE; 20 October - Comments on SARL 2008 Competition Handbook to be in; 20 and 21 october - JOTA and JOTI;

SARL News invites clubs and individuals to submit news stories of interest to radio amateurs and shortwave listeners. Submit news stories if possible in both English and Afrikaans to www.sarl.org.za/newsinbox.asp not later than the Thursday preceding the bulletin date.

The SARL also invites you to listen to the programme Amateur Radio Mirror International, on the air every Sunday morning at 10:00 CAT on 145,750 MHz in the Pretoria area with relays on 7 082, 7 205 and 17 590 kHz. For the web stream and echolink by ZS6FCS visit www.sarl.org.za, click on ARMI and follow the links. A repeat transmission can be heard Mondays at 21:00 CAT on 3 215 kHz. Sentech sponsors the ARMI transmissions on the non-amateur frequencies.

Today's South African Radio League news bulletin was compiled by George, ZS6NE, and transmitted by (your name and call sign).

Thank you for listening. 73.

/EX

"Congratulations to Mike Hale, VE7DXD, who has been elected British Columbia Section Manager for a two-year term of office that begins November 1, 2007. Mike was elected through mail-in ballot by a two-vote margin.

RAC Vice President for Field Services Bob Cooke, VE3BDB, extends thanks to Mike for his support of Radio Amateurs of Canada which he displayed by standing in nomination for BC SM, and to out-going Section Manager Drew Watson, VA7DR, for his strong leadership and promotion of our national organization, particularly of the RAC Amateur Radio Emergency Service. The election results indicate that both men enjoy wide recognition and support in BC Section."

Thanks.

73,

Bob

1 GB2RS NEWS Sunday 7 October

The news headlines

* HFC next weekend

* Train the Trainers course looms

* DFCWi used for EME contact

HF enthusiasts are reminded that the RSGB HF Convention takes place next weekend, 12 to 14 October. The closing date for booking accommodation packages and evening meals is 11am on Wednesday 10 October. You can of course just turn up on the Saturday or Sunday as a Day Visitor. Lunches are available without pre-booking. The RSGB HF Convention, sponsored by Icom and Martin Lynch & Sons, is the world's premier HF event of its type and an experience not to be missed by the serious operator.

A reminder to registered tutors that the RSGB's Train the Trainers scheme will run again shortly. The course, by Alan Betts, G0HIQ and Brian Reay, G8OSN, takes place on Sunday 21 October in Motherwell. For more information, or to register, contact RSGB Region 1 Manager Gordon Hunter, GM3ULP, as soon as possible. He can be contacted by email to gm3ulp@aol.com or by telephone on 01698 253394.

Last week GB2RS reported that 10GHz beacon GB3SCX was running an experimental mode, Dual Frequency CW with ident, or DFCWi. The world's first 10GHz EME contact using this mode has now been achieved. On 27 September, members of the Flight Refuelling Amateur Radio Society worked UK Microwave Group Chairman Brian, G4NNS, via DFCWi. Conventional CW was used to make initial contact. The DFCWi experiment took place using PC generated tones fed via a mic to a 2m SSB radio connected to a 3cm transverter. Both stations were using 12ft prime focus parabolic dish antennas, with 13W at G4RFR and 18W at G4NNS.

The RAYNET Convention and AGM will take place on Saturday 3 November at the East Sussex Fire and Rescue Headquarters, Eastbourne. Doors open at 9am and there will be presentations from 10am. The AGM starts at 2pm, and will be followed by an open forum. Disabled parking places are limited and should be reserved by contacting Dick.Jeffries@raynet-uk.net.

And now for the details of rallies and events for the coming week [Note to newsreaders: Please use your judgement on whether to read the 7 October event, based on your time slot and distance from the event.] On Sunday 7 October Nantwich Bunker Trust are having a surplus electronic and electrical sale. The sale starts at 10.00 at French Lane, Nantwich, Cheshire. For more information log onto www.hackgreen.co.uk/.

On Saturday 13 October the GB3EE repeater group rally takes place at the Calow Community Centre, Chesterfield. For more information contact Steve, G6IBQ, on 0844 414 2056 or email steveg6ibq@aol.com.

2 On Sunday 14 October Great Lumley Amateur Radio Club are holding their rally from 10.00 at the Great Lumley Community Centre. For more information contact Nancy Bone, G7UUR, on 0191 477 0036 or email nancybone2001@yahoo.co.uk. More details of these and future events can be found on pages 88 and 89 of the October edition of RadCom. Now for the news of special events John Howard, G0BUV, will be operating special event call sign GB8CMC from Birmingham until 9 October. The event is celebrating the 800th anniversary of the Coleshill Market Charter. The Charter was awarded by King John in 1207. Warrington Amateur Radio Club will be celebrating its 60th anniversary year by operating the special call sign GB6WRS throughout the month of October. The station will be active on all bands each day of the month. The Border Rievers Amateur Radio Society will be operating as GB4NTC on the 13 October, at Gragside House Rothbury. The station will be on the air from 1000 till 1800, operating on HF, VHF and UHF on voice and CW modes. Full details for the event can be found on their website www.brars.co.uk. And now the HF DX news compiled from 425 DX News, the Ohio-Penn DX Bulletin and other sources.

Andrew, G7COD, will be operating using 8Q7AK from the Island of Embudu, Maldives until October 12. He will be using SSB with a little CW on 30 to 12 metre bands. For more information check 8Q7AK on qrz.com. Javier, HR2J, will be running a one man expedition from 7 October to 8 November, and he expects to operate as HQ8R on all bands for at least four hours a day. Further information can be found on qrz.com under HQ8R. QSL direct to HR2J. Tom, DL2RTK, will be signing SD7T until 13 October activity from Ven Island, EU-137. The operators are Fred, SM7DAY, SM7DAY/7, Frank, DL2SWW, SD7W and Ric, DL2VFR, SD7V. QSL via home calls, bureau preferred. Richard, G3RWL, will be active as 8P6DR from Barbados, NA-021, WLOTA LH-0999, until 14 October. He plans to operate CW and digital modes on 80 to 10 metres. QSL via G3RWL, direct or bureau, e-mail requests for bureau cards to g3rwl at amsat.org. Look for Ermanno, SV0XAN/5, to be active from the islands of Lipsi, Agathonisi and Arkoi, Dodecanese, EU00 until 20 October. QSL via IK2WZD. Christoph, DK2CRN, (VK2AM) and George, DL1ECG, (VK2ALU) will be active from Australia on 9 to 27 October. QSL via home calls, direct or bureau. The W5 National Wildlife Refuge ARC will operate from the Hagerman National Wildlife Refuge on 12 to 14 October. This operation coincides with the National Wildlife Refuge Week and is in support of the KP1-5 Project and the US national wildlife refuge system. Look for W5NWR on SSB, CW, RTTY and PSK on frequencies of opportunity. QSL via NA5U. Other stations will be operating from wildlife refuges across the nation.
